Summary

This report is the Habitats Regulations Assessment (HRA) of the new Breckland Local Plan, prepared by Breckland Council. This report is an assessment of the plan at its 'Publication' stage, i.e. the plan is ready to be published for Examination. The plan making process to date has included an Issues and Options consultation, Preferred Directions consultation and a Preferred Site Options and Settlement Boundaries consultation. The latter consultation was in recognition of the need to specifically consider the right sites to meet housing need over the Local Plan period, in light of the longer timescales envisaged for bringing the full complement of housing forward in the Thetford and Attleborough Sustainable Urban Extensions.

HRA work has progressed alongside these plan making stages. At each stage, where new evidence or information has become available, it has been considered as part of the HRA. Of particular relevance is the availability of more up to date Stone Curlew survey data, which enabled a re-assessment and update of the Stone Curlew buffer zones as part of the Preferred Site Options and Settlement Boundaries HRA.

The general thrust of policy direction and the site allocations have therefore been the subject of HRA, and at this final Publication stage, this HRA report provides a full record of compliance and a final check for the incorporation of all recommendations made to date.

It is important to note that the mitigation measures to protect the European sites are those that have evolved from early and extensive evidence based work during the preparation of the Core Strategy. The buffer zones for Stone Curlew are established and understood, and continue to be a key mitigation measure (refined in light of the new data). Other mitigation measures are less well established, and this HRA therefore seeks to steer progression on those measures and ensure they are appropriately embedded within the Local Plan.

Mitigation measures are recommended in the likely significant effects screening table, under each appropriate assessment theme, and in text revisions for environmental policies ENV02 and ENV 03. The required measures to enable a conclusion of no adverse effects on site integrity are comprehensive, and Footprint Ecology has worked alongside the Council to develop measures within the plan. All recommendations made within this HRA report have now been fully incorporated into the Publication version of the plan, enabling a conclusion of compliance with the requirements of the legislation.

Key impact and mitigation themes are:

Impacts of built development on Stone Curlew

- Mitigation measures now well established and incorporated into the Local Plan through the Stone Curlew Buffer zones, updated in light of new data.

Recreation disturbance to SPA birds

- A measure not yet fully progressed from the Core Strategy HRA. Securing adequate recreation provision at new development, and working with partners to appropriately manage recreation, particularly at accessible forest sites. Commitments are now included in ENV 3.

Urbanisation effects on SAC and SPA habitats

- A measure not yet fully progressed from the Core Strategy HRA. Framework now committed to within Policy ENV 3 for working with relevant partners to protect and restore the most urban heath sites, with a requirement for developers to contribute to measures within the framework where development may lead to increased recreation use of urban heaths.

Additional measures in sensitive areas of focussed growth (Thetford, Swaffham, Mundford).

- Informed by recent additional evidence gathering in conjunction with Norfolk LPAs. Policy ENV 3 now includes a requirement for additional focussed measures at Thetford, Swaffham and Mundford.

Air quality and road improvements

- Measures remain consistent with Core Strategy HRA – no road improvements promoted within 200m of Breckland SAC, and within 1500m of Breckland SPA. Additional requirements for project level HRA for road schemes. Air quality protection measures and monitoring needs should be reviewed in order ensure adequate protective measures to prevent deterioration.

Water supply, water quality and waste water discharge, flood risk

- The WCS update has triggered the need for additional policy strengthening for growth at Dereham and the Attleborough SUE. The Flood Risk Assessment update includes measures now incorporated into policy.

Footprint Ecology would like to thank Jemma March of Capita, for her continued assistance during preparation of this HRA report, including positive discussions on mitigation improvements and policy wording. The RSPB assisted with data interpretation and ongoing discussions in relation to the buffer updates.

1. Introduction

1.1 This report is the Habitats Regulations Assessment (HRA) of the new Breckland Local Plan, currently being prepared by Breckland Council. This report is an assessment of the plan at its 'Publication' stage, i.e. the plan is ready to be published for Examination. This HRA report is now finalised, having checked that all recommendations are incorporated. This HRA therefore demonstrates soundness in terms of compliance with the Conservation of Habitats and Species Regulations 2010, as amended, normally referred to as the 'Habitats Regulations'.

1.2 HRA is a systematic assessment, undertaken in order to check the implications of a plan or project for European wildlife sites, in terms of any possible harm on wildlife interest that could occur as a result of the plan or project. Further explanation of the assessment process is provided below and in greater detail in Appendix 1.

1.3 At the present time, spatial planning and development management in the Breckland District is led by the Breckland Local Development Framework, which is a suite of planning documents adopted by the Council between 2009 and 2012, incorporating the Core Strategy, the Site Specific Policies and Proposals Document and the Thetford Area Action Plan. These documents initially began to be prepared in 2007, and HRA work commenced shortly after, when it was recognised that new growth had the potential to affect European wildlife site interest. Breckland Council, with advice from Natural England, understood that in preparing spatial planning documents, there is a need to properly assess potential impacts on European sites in accordance with the duties placed upon the Council by the Habitats Regulations.

1.4 It is Government policy that local planning documents are continually reviewed in order to remain up to date and informed by current evidence on local economic, social and environmental needs, and national legislation and planning policy. In light of this, and recognising the need to revisit key issues such as housing targets since the cessation of a region led approach to planning through Regional Spatial Strategies, Breckland Council has prepared a new Local Plan, which upon adoption will replace the suite of documents within the current Breckland Local Development Framework. The new plan has proceeded through the various stages of plan preparation and public consultation, including Issues and Options, Preferred Directions and an additional consultation on Preferred Site Options and Settlement Boundaries, followed by draft Submission. Each has been the subject of HRA, and this report now updates the previous HRA work.

1.5 The new Breckland Local Plan will replace all documents within the Local Development Framework, which were also the subject of HRA. When embarking on new HRA work, it is important to take stock and consider how well the measures put in place to protect European site interest have been effective, whether they are understood and

followed correctly, and what evidence there is available to support the continuation of such measures, or to indicate that they may need modification. Therefore, in order to inform the early development of the new Local Plan, Breckland Council commissioned Footprint Ecology to produce a background and review of evidence document; which reviewed previous HRA and evidence gathering work and considered what evidence should inform the HRA of the new Local Plan. That initial report should be read in conjunction with this HRA report as it is the precursor to the HRA reports at each stage of the emerging new Local Plan, and provides a greater level of detail on the evidence that underpins this HRA.

1.6 This report provides HRA at the Publication, and builds upon the previous HRA reports at earlier plan making stages. This report has been produced based on a Publication version of the Local Plan, which was provided to Footprint Ecology in July 2017. This HRA report assesses the plan in a form that Breckland Council consider to be sound and ready for Examination by the Planning Inspectorate. Footprint Ecology has worked with planning officers over time, during the preparation of this HRA report, to embed mitigation measures within the plan and in particular to strengthen the Environment chapter and associated policies.

1.7 Should there be any modifications to the plan as a result of the Examination, these may need to be assessed further in terms of potential effects on European sites, prior to the adoption of the plan. If this is the case, a final update to the HRA will therefore be made when the new Local Plan is considered ready for adoption, and will consist of a check of any modifications in order to confirm that the new Breckland Local Plan fully accords with the requirements of the Habitats Regulations, before the Local Plan is given effect.

Habitats Regulations Assessment process

1.8 A HRA is the step by step process of ensuring that a plan or project being undertaken by, or permitted by a public body, will not adversely affect the ecological integrity of a European wildlife site. Where it is deemed that adverse effects cannot be ruled out, a plan or project must not proceed, unless exceptional tests are met. This is because European legislation, which is transposed into domestic legislation and policy, affords European sites the highest levels of protection in the hierarchy of wildlife sites designated to protect important features of the natural environment.

1.9 The relevant European legislation is the Habitats Directive 1992¹ and the Wild Birds Directive 2009², which are transposed into domestic legislation through the Conservation of Habitats and Species Regulations 2010, as amended. As noted above, these Regulations are normally referred to as the 'Habitats Regulations.'

¹ Council Directive 92/43/EEC

² Council Directive 2009/147/EC

1.10 This legislation sets out a clear step by step approach for decision makers considering any plan or project. In England, the duties within the legislation are also supplemented by national planning policy through the National Planning Policy Framework (NPPF). In addition to sites classified or designated in accordance with the European Directives, the NPPF also refers to Ramsar sites, which are listed in response to the international Ramsar Convention. The NPPF requires decision makers to apply the same protection and process to Ramsar sites as that set out in legislation for European sites. Formally proposed sites, and those providing formal compensation for losses to European sites, are also given the same protection.

1.11 The duties set out within the Habitats Regulations apply to any public body or individual holding public office with a statutory remit and function, referred to as 'competent authorities.' The requirements are applicable in situations where the competent authority is undertaking or implementing a plan or project, or authorising others to do so. A more detailed guide to the step by step process of HRA is provided in this report at Appendix 1.

1.12 In assessing the implications of any plan or project, in this case a local plan, for European sites in close proximity, it is essential to fully understand the sites in question, their interest features, current condition, sensitivities and any other on-going matters that are influencing each of the sites. Every European site has a set of 'interest features,' which are the ecological features for which the site is designated or classified, and the features for which Member States should ensure the site is maintained or, where necessary restored. Each European site has a set of 'conservation objectives' that set out the objectives for the site interest, i.e. what the site should be achieving in terms of restoring or maintaining the special ecological interest of European importance.

1.13 The site conservation objectives are relevant to any HRA, because they identify what should be achieved for the site, and a HRA may therefore consider whether any plan or project may compromise the achievement of those objectives. Further information on European site conservation objectives can be found at Appendix 2 of this report.

1.14 As explained within Appendix 2, the conservation objectives for European sites are prepared for Natural England, and consist of two levels; overarching generic conservation objectives and site specific supplementary advice. The latter is currently not in place for all European sites, and at the time of preparing this HRA report, was not finalised for Breckland SPA and SAC, which is the most pertinent site for this HRA. This HRA therefore has regard for the locally available information that assists with the consideration of the overarching objectives, and what may impede their delivery.

1.15 Local plan making proceeds through a number of stages as the plan is developed and refined, with public consultation at key stages where statutory bodies, organisations, business and the public are able to contribute to the direction of the developing plan. The Breckland Local Plan is now at Publication stage. Alongside the HRA reports the Council has

used previous consultation responses provided by consultees at the 'Issues and Options' stage and Preferred Directions stage, with a further consultation on Preferred Site Options and Settlement Boundaries, to inform the development of suitable policy measures to protect European sites and ensure that their restoration and enhancement is not affected by the Local Plan and its implementation.

1.16 At each stage of plan development, policies are presented in an increasingly refined state over time, with intended approach to policy wording is outlined and consultation informing further refinement of policy wording. This therefore enables HRAs to make meaningful recommendations that can be acted upon in order to strengthen the protection afforded to European sites through the forthcoming plan, prior to its Examination.

1.17 It is important to recognise that a HRA is an intrinsic part of plan making. It identifies potential risks to European sites posed by an emerging policy approach, but it should also seek to find solutions that enable sustainable development to meet the needs of an area whilst protecting, restoring and enhancing European sites. This HRA recommends measures to allow plan objectives to be met whilst avoiding or minimising risk. The Council must adequately apply the protective legislation for European sites, and the HRA advises how that can be best achieved. Where there are identified risks to European sites within the plan and solutions do not appear to be available or evidence to support a solution is not robust, it is then necessary to consider a different policy approach.

1.18 As described in Appendix 1, the step by step process of HRA, and the updating of HRA reports at each plan making stage of an emerging plan, allows for continual refinement of the plan to ensure its compliance with the Habitats Regulations. At the various stages of plan development, the HRA checks the plan in its entirety each time, and will advise where emerging elements of the plan may pose a risk to European sites and therefore require further evidence gathering and/or modifications to the plan.

Policy progression through plan preparation

1.19 The new Local Plan has progressed through stages of plan preparation that have enabled it to be informed by public consultation, with input from statutory consultees and use of an extensive evidence base. Alongside this, plan assessments, including HRA, have informed policy evolution to make sure that the new Breckland Local Plan is compliant with the requirements of legislation and planning policy.

1.20 The evolution of policy since the Preferred Directions stage is particularly pertinent to this HRA, as explained below.

Evolution of policy from the Preferred Directions

1.21 The Preferred Directions document was prepared after initial consultation on Issues and Options for the local plan. The Preferred Directions document set out an indication of

preferred policy in terms of the nature and spread of new housing development for 14,925 houses over the plan period of 2011 to 2036. This included a focus on housing delivery in key settlements, including the two Sustainable Urban Extensions (SUEs) at Thetford and Attleborough. After preparation and consultation on the Preferred Directions document it was recognised that the SUEs for Thetford and Attleborough would not be delivered in their entirety within the new local plan period of 2011 to 2036. These two new settlements are a key component of housing delivery for Breckland, but will not be able to deliver their full complement of housing before 2036.

1.22 Breckland Council therefore had to seek alternative means of delivering additional housing to meet the projected housing needs during the plan period. An additional document; the Preferred Site Options and Settlement Boundaries document was subsequently prepared to identify a revised distribution of housing, with a higher level of provision at the larger settlements than previously presented within the Preferred Directions consultation document. Furthermore, the Preferred Site Options and Settlement Boundaries document proposed that 5% of the housing need should be provided in rural areas, which was a change to the Preferred Directions document that did not include rural area development.

1.23 Recognition that the two SUEs will not be able to deliver their full complement of new housing prior to the end of the plan period in 2036 necessitated a revised distribution of housing, with additional housing numbers targeted towards existing larger settlements, in order to make up the 20% shortfall of the overall housing target for the plan period. The revised distribution also recognises that a small contribution to housing numbers can be made in rural areas, and a 5% target for rural areas was added as part of the Preferred Site Options and Settlement Boundaries document.

1.24 The Preferred Site Options and Settlement Boundaries document was consulted upon as an additional step at Preferred Directions, informed by new evidence. It set out the proposed preferred site options and settlement boundaries that would form part of the new local plan, along with additional consideration of the approach to development in rural areas. The consultation documentation advised that the Preferred Directions consultation and the Preferred Site Options and Settlement Boundaries consultation would together enable the plan to be developed further and amalgamated into the new Breckland Local Plan Part 1. The new local plan is now prepared for Examination by the Planning Inspectorate for Examination, and it is the Publication stage that is the subject of this HRA report.

Breckland Local Plan at draft Submission stage

1.25 This HRA report assessed the draft Submission stage plan in full, including a complete re-check of all elements of the plan, which refer to general overarching policies, housing, transport, environment, the economy, communities and infrastructure.

1.26 The avoidance and mitigation measures built into the plan to date draw on the wealth of previous HRA work and underpinning evidence. The HRA report at submission stage checked previous recommendations and current evidence to highlight outstanding matters requiring modifications to the plan, and checked the robustness of existing mitigation measures to determine whether still fit for purpose, in light of the new proposals, quantum and locations of development in the plan at this stage. Modifications recommended were set out in the table at Appendix 4 and within the subsequent Appropriate Assessment sections of this report.

Breckland Local Plan and Publication stage

1.27 This HRA report is now finalised, based on the Local Plan at Publication stage. A check was made to ensure that all recommendations for mitigation measures, set out in both the table at Appendix 4 and within the subsequent Appropriate Assessment sections of this report are now fully incorporated within the plan. The final column of the table at Appendix 4 has been added to record the check made. The Appropriate Assessment sections have been updated to reflect the checks made and the conclusions drawn for this HRA at Section 8 now modified.

European sites

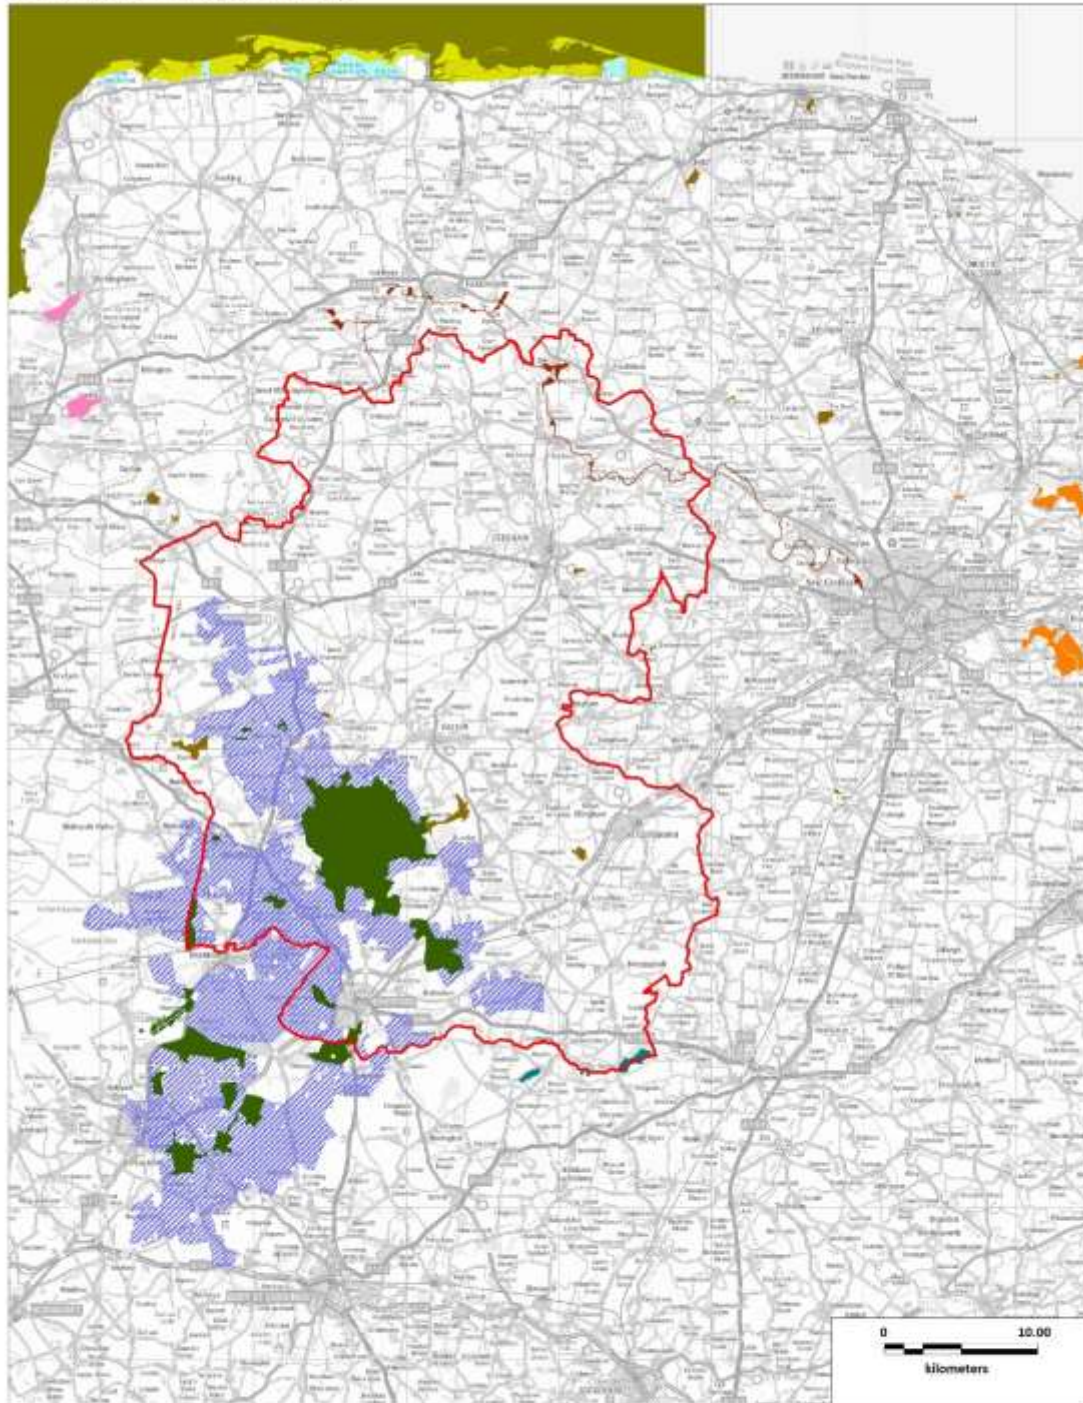

1.28 There are a range of European sites within or near the Breckland District that have been checked at each plan making stage, for their potential to be affected by new growth that will be promoted by the new Breckland Local Plan Part 1. The sites considered within this report are drawn from the original HRA work on the Breckland Core Strategy, and then reviewed in the aforementioned background evidence document. The check in 2008 involved identifying all European sites that fell within a 20km buffer of the District to give an initial list. A few sites were then removed from that list because they were so far from the District and their interest/character meant there was no plausible mechanism by which impacts might occur. Sites are listed in Table 1 and the main sites are shown on Map 1.

Table 1: Relevant sites (taken from Liley *et al.* 2008)

SPA	SAC	Ramsar
Breckland	Breckland	Broadland
Broadland	Norfolk Valley Fens	North Norfolk Coast
North Norfolk Coast	North Norfolk Coast	Ouse Washes
The Wash	Ouse Washes	Redgrave & Lopham Fens
Ouse Washes	River Wensum	The Wash
	The Broads	
	The Wash and North Norfolk Coast	
	Waveney and Little Ouse Valley Fens	

1.29 Appendix 3 provides site by site interest features for each European site. The background and review of evidence document provides further detail on each of the European sites.

2. Previous HRA work

2.1 A review of all previous HRA work and current measures in place to protect European sites is provided in summary in this section. This includes HRA work for the Local Development Framework, and the use of new evidence during the progression of the HRA for the new Local Plan up to its current Publication stage.

The Breckland Local Development Framework

2.2 Previous HRA work relating to the Local Development Framework was assessed as part of the background and review of evidence document prepared for the commencement of new HRA work alongside the new Breckland Local Plan. A summary is provided here and more comprehensive detail can be found in the background and review of evidence document.

2.3 Breckland District Council currently has a suite of development plan documents in place to guide the nature and location of sustainable development for the District and inform planning decisions up to 2026, within what is known as the 'Breckland Local Development Framework.' The Local Development Framework consists of:

- The Core Strategy
- Site Specific Policies and Proposals
- Thetford Area Action Plan ('TAAP')

Evidence used for the HRA of the Local Development Framework

2.4 The HRA work for the Local Development Framework was informed by a considerable amount of evidence gathering to establish the sensitivities of European site interest to new growth. This has since been supplemented by a range of relevant studies initiated by Breckland Council and other parties. Key evidence, explained in more detail in the background and review of evidence report, includes:

Visitor surveys

- Visitor surveys and visitor modelling relating to Breckland SPA sites (Thetford Forest undertaken by UEA for Breckland Council (Dolman, Lake & Bertoncej 2008)
- Visitor survey work undertaken for other local authorities (Fearnley, Liley & Cruickshanks 2011)

Stone Curlew

- Original research on housing, roads and Stone Curlews commissioned by Breckland Council (Sharp *et al.* 2008a)
- Modelling of impact of additional traffic on the A11 (Clarke, Sharp & Liley 2009)
- Peer-reviewed paper mainly based on data in 2008 report with some additional analysis (Clarke *et al.* 2013)
- Additional work on Stone Curlews, focussing on impacts of buildings (Clarke & Liley 2013a)

Nightjar and Woodlark

- Nest predation study, commissioned by Breckland Council (Dolman 2010)
- Analysis of Woodlark and Nightjar trends across Thetford Forest, to determine why population of these species is declining markedly, commissioned by Forestry Commission (Dolman & Morrison 2012)

Table 2: Summary of adverse effects identified (and discussed in detail) in the Core Strategy HRA (Liley *et al.* 2008). Table taken from HRA for the TAAP (Liley & Tyldesley 2011)

Direct impacts of built development on Annex I bird species	There is strong evidence that Stone Curlew, Nightjar and Woodlark all
Disturbance to Annex I birds associated with heathland and farmland habitats as a result of recreational use	
'Urban effects'	

Recreation impacts to coastal habitats and species	Coastal habitats and some coastal species are vulnerable to impacts
Water abstraction	
Discharges affecting water quality	Discharges from waste water treatment works may increase levels of nutrients in the water, leading to loss of water quality.
Contamination from flood water	
Air pollution from road traffic	
Avoidance of roads by Annex I birds	Evidence that Stone Curlews occur at lower densities adjacent to main roads (Day 2003; Sharp <i>et al.</i> 2008a).

Mitigation measures for the Local Development Framework

2.5 Informed by evidence gathered, the HRA for the Local Development Framework documents focused on the following potential impacts arising from new development:

- Reduction in SPA bird density (Stone Curlew, Nightjar and Woodlark) in proximity to new development
- Increased disturbance of SPA birds (Stone Curlew, Nightjar and Woodlark) arising from additional recreational activity
- Increased levels of urbanisation related impacts to SAC heaths, as a result of increased numbers of people (including trampling, fly-tipping, fire risk)

- Traffic generated air pollution affecting SAC heaths
- Demand for new/upgraded roads leading to avoidance of habitat in close proximity by SPA birds (Stone Curlew, Nightjar and Woodlark).

2.6 The HRA work also included consideration of impacts on other European sites further afield; the North Norfolk Coast, The Wash, Ouse Washes and The Broads. Impacts on these sites potentially include recreational disturbance and deterioration of water supply and water quality.

2.7 The following mitigation measures are currently applied for the Local Development Framework, in light of the previous HRA findings and recommendations made.

- Direct effect of built development on SPA birds = policy wording and 1500m/400m zones mapped
- Indirect effect of disturbance = policy wording committing to a recreation management, monitoring and mitigation strategy in collaboration with partners
- Urban effects on heaths around Thetford = developer funded approach to urban heaths management and the provision of alternative green spaces
- Recreation pressure on the North Norfolk Coast = Plan wording to commit to new research and collaboration with other neighbouring local authorities
- New and upgraded roads = policy commitment to preventing any new roads or road improvements within 200m of Breckland SAC
- New and upgraded roads = excluded from the 1500m Stone Curlew zone
- Water issues = policy wording to secure flood alleviation measures and commitment to bringing forward new development in step with infrastructure and supply improvements

Status of Local Development Framework mitigation measures

2.8 The previous HRA work is critical to the assessment now being undertaken of the new Breckland Local Plan, as this HRA evolves from and builds on that previous work. The mitigation measures now currently being implemented through the Local Development Framework, have therefore been considered again as part of the HRA work for the new plan, in terms of their current status and progression in implementation.

2.9 The measures now being implemented for the Local Development Framework were reviewed in detail in the background and review of evidence report. The findings and recommendations of that report should be read alongside this HRA report, but are summarised here. The background and review of evidence report found that:

- The 1500 zonation for the protection of breeding Stone Curlew remains a strong, evidence backed and essential mitigation mechanism, but that there may be some scope to make improvements with regard to the interpretation and consistent application of the policy.
- The 1500m zone for birds nesting outside the SPA needs to be updated and mitigation options carefully considered.
- It is recommended that the 400m zone for project level HRA remains within policy for the new Local Plan, because Nightjars and Woodlark are declining in the Brecks and therefore possibly more vulnerable to additional pressure.
- Thetford remains a growth priority for Breckland, and therefore the proximity of the Breckland European sites boundary to the edge of the town in most directions remains a fundamental issue to overcome.
- There is an urgent need to progress an approach to manage and monitor recreational impacts for the District as a whole, and also the specific requirement to secure an evidence based, consistent and pre-agreed mitigation package for the Thetford urban heaths, in particular Barnham Cross Common. Specific options for allocations will need to be checked against current mitigation measures including the zones, proximity to Thetford urban heaths etc.
- Air pollution issues will remain a concern as the plan develops. It will be necessary to gather evidence to identify what level and location of growth may trigger the need for new roads or road upgrades, and then how such needs could be alternatively accommodated without adverse effects on European site interest.
- An update to the previous situation with regard to water supply, waste water treatment and water infrastructure is necessary to understand what progress has been made to date, what work is planned and what level of growth is still not accommodated by existing or planned work is necessary. Growth at Attleborough will need to be considered alongside the findings and further recommendations of the Water Cycle Study, and should have particular regard for the isolated site of the Norfolk Valley Fens SAC located to the south west of Attleborough.
- Tourism impacts will need to be adequately covered in the HRA as well as those arising from new residential development. There is currently a Norfolk wide project looking at recreational use of Norfolk European sites, with Breckland Council actively involved and contributing to this work, and that project needs to inform this Habitats Regulations Assessment.

HRA evidence informing the Breckland Local Plan Part 1

2.10 Since the HRAs were undertaken for the Local Development Framework, new evidence and resultant analysis is available to inform the HRA work for the new Breckland

Local Plan Part 1. This includes new up to date Stone Curlew data that became available in time to be included as part of the HRA at the Preferred Site Options and Settlement Boundaries document stage. New evidence has refined recommendations for mitigation measures.

2.11 This HRA now includes a check that previous recommendations made in the HRA reports for both the Preferred Directions and Preferred Site Options and Settlement Boundaries documents have now been incorporated in the current version of the plan. These checks can be seen in both the re-screening of the plan for likely significant effects, and the appropriate assessment sections that follow from that screening.

Further assessment of the relationship between buildings and Stone Curlew Distribution

2.12 An important part of the original Core Strategy evidence base is the all of the research relating to the effect of built development on Stone Curlew. Following on from the Core Strategy evidence, Breckland Council commissioned Footprint Ecology to undertake an update to the original evidence by further assessing the relationship between buildings and Stone Curlew in the Brecks by using Stone Curlew nesting data and examining distribution in distance bands around buildings and in proximity to roads. The research is reported in Clarke & Liley 2013a.

2.13 The modelling and statistical analysis undertaken on the data revealed that there is still a strong justification for the use of the 1500m SPA buffer and secondary functionally linked land buffer. The negative relationship between Stone Curlew and buildings remains clear, but it is possible that some building types may not have an impact. Agricultural and commercial buildings do not appear to have a negative correlation, but this result requires caution as it was only possible to decisively identify these building types for a small sample size, with most buildings not being classified based on their specific use.

2.14 The effect of built development on Stone Curlew is more pronounced where there isn't any existing development. This leads to a conclusion that infill development, i.e. where the new development is completely eclipsed by existing development on all sides due to being located entirely within an existing settlement, may not further add to the effect.

Updated Stone Curlew data

2.15 More recent Stone Curlew data are now available, as a result of the new set of annual monitoring data collated annually by the RSPB having been made available. These data have been obtained and used to check the distribution outside (but functionally-linked) to the SPA and the most recent records are now added to those previously analysed for the Core Strategy and then the updated research described above.

2.16 The results of data checks and the modifications to the mitigation are set out in more detail within the appropriate assessment section of this HRA.

Updated GIS analysis of sites proposed for development

2.17 The Preferred Site Options and Settlement Boundaries document provides detailed preferred policy in relation to the Breckland settlements. The HRA for the Preferred Directions document included an initial set of preferred and alternative sites for development. As described earlier, this has now been revised by the Council and an updated set of preferred and alternative sites was consulted upon as part of the Preferred Site Options and Settlement Boundaries document. The HRA of the Preferred Directions document undertook GIS analysis of the preferred and alternative sites, to identify any risks. That analysis was then re-run for the updated set of sites as part of the Preferred Site Options and Settlement Boundaries HRA. The draft Submission version and now the Publication version of the plan takes forward the selected sites from the previous plan iterations, informed by the previous HRA findings.

Norfolk wide evidence gathering on recreation impacts

2.18 Visitor survey work has been undertaken across Norfolk (during 2015 and 2016) as part of strategic work commissioned by Norfolk County Council on behalf of all Norfolk local authorities. The survey work included European sites across the county and a selection of access points that were ones where it was thought there could be issues relating to access and nature conservation. Survey work was timed when issues were most likely to occur.

2.19 The report (Panter, Liley & Lowen 2017) includes considerations of the likely scale changes in access as a result of development in the current plan period. A 14% increase in access by Norfolk residents to the sites surveyed (in the absence of any mitigation), was predicted as a result of new housing during the current plan period. The increases for sites in the Brecks were much higher than the Norfolk-wide 14% increase and as such development in the Breckland area, due to its proximity and scale, has particular implications in terms of recreation. These results are relevant in considering the impacts from the overall quantum of development and the likely scale of change in recreation at sensitive sites, with particular increases predicted from growth within Thetford, Swaffham and Mundford.

The forthcoming Breckland Infrastructure Delivery Plan

2.20 This plan is currently in preparation. It is an evidence base to support the delivery of the Local Plan, and its purpose is to identify the District's infrastructure needs for the plan period (up to 2036), in particular, those needs arising from new development;

- Set out the costs, funding sources and delivery mechanisms associated with these infrastructure needs;

- Improve lines of communication between key delivery agencies and the local planning authority, including identifying opportunities for integrated and more efficient service delivery and better use of assets;
- Provide evidence for the setting of a Community Infrastructure Levy (CIL), should the Council wish to implement such a funding mechanism in the future;
- Provide a 'live' document that will be used as a tool for helping to deliver infrastructure, regularly updated to reflect changing circumstances and needs and;
- Further strengthen relationships between the Council's Corporate Plan and the Local Plan objectives.

2.21 The Infrastructure Delivery Plan presents an opportunity to embed some of the mitigation measures recommended in the appropriate assessment sections of this HRA report, and Footprint Ecology can liaise with Breckland Council if required, to advise how this might be achieved as the Infrastructure Delivery Plan is progressed.

3. Screening for likely significant effects

3.1 At the screening stage of HRA for a plan, there is the opportunity to identify changes to the plan that could be made to avoid risks to European sites. The screening for likely significant effects is an initial check to identify risks and recommend any obvious changes that can avoid those risks.

Screening for likely significant effects table

3.2 Appendix 4 provides the screening table for the full plan at Publication stage, based on the July 2017 Publication version of the plan. Note that policy numbers have changed subsequent to earlier drafts of the plan. The screening table therefore provides reference to the new policy numbers, as provided to Footprint Ecology by the Council, in the Publication version. The screening table at Appendix 4 now records the screening undertaken on the plan at Publication stage. A similar screening exercise has been undertaken on the Issues and Options, Preferred Directions and Preferred Site Options and Settlement Boundaries documents, and then the draft Submission, with the HRA report updated each time, and further assessment undertaken in appropriate assessment sections, as required. Earlier screening tables can therefore be found in the previous versions of this HRA report, accompanying the plan consultations at these formal plan making stages.

3.3 When conducting a screening of a plan for likely significant effects, all aspects of the emerging plan that influence sustainable development for the area are checked for risks to European sites. The table at Appendix 4 records the screening undertaken for the Breckland Local Plan Part 1 at Publication stage, with conclusions drawn and recommendations made for each policy proposal. It is important to note that at Publication stage, the plan is considered sound by Breckland Council, and any recommendations will therefore not alter the plan prior to its Examination, rather this report will be made available to the Examining Inspector, and may therefore inform any modifications prior to adoption of the plan.

3.4 The screening table provides recommendations for text changes or additions within the plan. Text changes are recommended in the screening table where there is a clear opportunity to avoid impacts on European sites through policy strengthening. In such instances, the risk is not such that further assessment of impacts is required, but rather that the impacts can be simply avoided with straightforward changes to the plan.

3.5 Where risks to European sites are identified but further scrutiny of information, further evidence gathering or assessment of the nature and extent of impacts is required, the screening table records a recommendation for those aspects of the plan to be looked at in greater detail, with reference to relevant evidence and information. This assessment is the 'Appropriate Assessment' stage, forming later sections of this report, from section 4 onwards.

3.6 Where identified aspects of the plan are brought forward for appropriate assessment, it is on a precautionary basis. Where there are uncertainties, it is usually more beneficial to assess potential risks in greater detail, with proper reference to evidence, than to try to screen out an element of the plan from any impact whatsoever. Where an impact can be clearly avoided, the screening stage is useful in narrowing down to those elements of the plan that poses a risk to European sites, but if there are risks or uncertainties, the HRA is more robust if those are assessed in the appropriate assessment. This allows for better quantification of risk and more targeted action to prevent adverse effects.

Impact themes

3.7 From the screening undertaken on the plan, it is clear that likely significant effects can be categorised under a small number of key themes. These themes have been current throughout the HRA work at previous stages of plan making, and this HRA report at Publication stage now updates the HRA sections by revisiting each theme.

3.8 By structuring the appropriate assessment under these themes, the issues can be assessed in a logical and scientific way, with relevant evidence for each theme scrutinised. The key themes that form the sections of the appropriate assessment are:

- Reduced densities of SPA bird species in response to increased development presence
- Urban effects, which include trampling, increased fire risk, eutrophication etc. We also include recreation disturbance of SPA bird species here.
- Increased traffic volumes, road improvements and new roads, and air quality deterioration
- Water issues, including flooding, water resources and water quality

3.9 The key themes are risks that are present because there is a potential 'pathway' between the policy proposal in the plan, and one or more interest features of the European site. In other words, there is an identifiable process by which the interest feature could suffer harm. Figure 1 has been used throughout the HRAs at each plan making stage, as it provides a helpful illustration of the impact pathways identified and the European sites potentially affected, which then relate to the appropriate assessment sections of this report.

3.10 Within the appropriate assessment each of the impact themes are assessed and mitigation checks are made in terms of the following:

- Underpinning evidence for the impact and the measures developed to mitigate.
- The mitigation measures developed, progress to date and what now needs to be done to take the measures forward (noting where progress has progressed well and where those that are not yet progressed now need to be prioritised).

Figure 1: Pathways by which Likely Significant Effect is triggered by different elements within the plan. This diagram outlines the structure of the Appropriate Assessment section of the report, with green shading reflecting headings within the Appropriate Assessment. Red dotted lines reflect closely related impacts pathways

4. Appropriate assessment - reduced densities of key bird species in relation to urban development

Background

4.1 Studies from the UK that compare densities of Stone Curlew, Nightjar and Woodlark along an urban gradient show that reduced densities occur where development levels are high (Liley & Clarke 2003; Mallord 2005; Liley *et al.* 2007; Sharp *et al.* 2008a; Clarke & Liley 2013a).

4.2 For Nightjar and Woodlark the various studies (Liley & Clarke 2003; Mallord 2005; Liley *et al.* 2006) involve sites with public access. The reduced densities on sites with high levels of nearby housing may therefore relate to impacts from recreation (Murison 2002; Mallord *et al.* 2007) and/or other factors such as increased cat predation (Beckerman, Boots & Gaston 2007; Baker *et al.* 2008; van Heezik *et al.* 2010; Floyd & Underhill-Day 2013), increased fire risk (Kirby & Tantram 1999; Underhill-Day 2005) or other 'urban effects' (see Underhill-Day 2005 for review). The studies that show impacts on Nightjar and Woodlark have been conducted in areas where there is a high level of urban development surrounding heathland sites, for example in Dorset or the Thames Basin Heaths. By contrast, the impact of buildings for Stone Curlew relates to agricultural land, often with little or no public access and the avoidance of built areas is detectable over large distances. Considerations for Stone Curlews are therefore unique.

4.3 This section of the appropriate assessment therefore focuses on impacts on Stone Curlew and the avoidance of buildings. A separate appropriate assessment section of this report focuses on urban effects, and we include impacts from recreation within that section.

4.4 Previous HRA work for the Core Strategy (Liley *et al.* 2008) identified likely significant effects from development within 1500m of the parts of the Breckland SPA relevant for Stone Curlew³ or within 1500m of areas outside the SPA supporting notable numbers of Stone Curlews. The HRA was informed by work undertaken by Footprint Ecology (Sharp *et al.* 2008a). The use of a 1500m zone around the SPA to identify locations where likely significant effects would be triggered and where adverse effects on integrity would be difficult to rule out has been a consistent approach in strategic HRA work since. Further data analysis (Clarke & Liley 2013a) built on the previous findings, consistently finding avoidance of arable land by Stone Curlews around individual settlements across the Brecks. That work found significant effects out to at least 1500m and, when trying to separate

³ Note the SPA also includes areas of forestry plantation that do not tend to support Stone Curlew but are included in the SPA because they support Nightjars and Woodlarks.

different types of buildings, found some evidence that residential, rather than other types of building, were linked to the avoidance pattern found.

4.5 The analysis of Liley & Clarke was based on actual buildings, using GIS data representing the individual footprint of buildings extracted from GIS data. The predicted impact of a building is greater where the present area of nearby buildings is low (i.e. greater impact for isolated buildings) and suggests that the total area covered by the nearby buildings has some influence over and above the simple number of nearby buildings. The analysis provides no indication of what factor or factors are behind the avoidance of built development by stone curlews, nor does the analysis provide any evidence of particular mitigation approaches and their effectiveness.

Check & revision of 1500m buffers

4.6 In order to avoid impacts of built development on Stone Curlews, the Breckland Local Development Framework policies within the various planning documents produced up to now have included a 1500m zone around the parts of the Breckland SPA where Stone Curlews are present. Within such a zone a likely significant effect from new development is presumed at the plan level and adverse effects cannot be ruled out⁴. This zone was originally defined as part of HRA work undertaken around 2008 (following analysis of Stone Curlew distribution and housing; Sharp *et al.* 2008). We now refer to this buffer as the 'primary buffer'.

4.7 The Stone Curlew population is currently increasing and the birds use areas outside the SPA boundary for both breeding and foraging. To provide protection for Stone Curlews that were nesting outside the SPA, but likely to be part of the same SPA population, planning policy such as the Breckland Core Strategy identified supporting habitat areas outside the SPA where birds had regularly nested. A criterion based on 1km grid cells that had held 5 or more Stone Curlew nests over the period 1995-2006 was used to identify areas outside the SPA that had been regularly used, and a 1500m buffer then applied to these areas⁵. Within this second buffer, it was concluded that likely significant effects would be triggered by new development and project level HRA would be required. As the potential impact related to supporting habitat rather than core habitat within the SPA, it was anticipated that alternative supporting habitat to provide the same function could be provided as mitigation. We refer to this buffer, relating to areas outside the SPA boundary, as the secondary buffer.

4.8 It is now timely to review the buffers previously used. While there is still strong evidence that the 1500m distance is appropriate (Clarke & Liley 2013b; Clarke *et al.* 2013), it is important to ensure up to date data are used to reflect the areas of the SPA used by Stone

⁴ Unless that development is within existing urban areas and is in-fill

⁵ The buffer is included in the Breckland Core Strategy on page 27, 2.6 key diagram: it is represented by blue hatching

Curlews and the areas outside the SPA that are also important. New Stone Curlew data has been obtained from the RSPB, which covers the period 2001 to 2015. This provides an opportunity to revise the buffer zones for Stone Curlew, and revised buffers were included in the HRA for the Preferred Site Options and Settlement Boundaries. Revision of the buffers will strengthen the policy approach to protecting Stone Curlew, in light of the most up to date information available.

4.9 We have data provided by the RSPB (2011-2015 inclusive) to review the buffer relating to supporting habitat outside the SPA. We have used five years of bird data as survey coverage has varied between years to some extent, meaning use of a longer time window would risk there being areas of differential survey effort. The RSPB provided data on which areas had been surveyed for the period 2011-2015 (i.e. where surveys had been undertaken during the five-year period), but did not break down survey effort between years. The choice of five years allows us to match bird data and survey coverage. While data from 2016 were also available, survey coverage was further scaled back by the RSPB in 2016 so that data were not used.

1500m buffer for the SPA ('primary buffer')

4.10 A 1500m buffer was drawn around the Breckland SPA, with the exception of the following:

- The entirety of Cranberry Rough, Hockham SSSI and the Rex Graham Reserve SSSI were excluded as neither support habitat suitable for Stone Curlews
- Breckland Forest SSSI was largely excluded. A review of Stone Curlew data showed parts of units 1 and 3 had supported nesting attempts by Stone Curlew during the period 2011-15. Relevant compartments⁶ (based on SSSI unit GIS layer) were therefore buffered.

1500m for the areas outside the SPA ('secondary buffer')

4.11 Areas outside the SPA that have supported a number of recent nesting attempts were identified as follows:

- We used a grid of 1km squares, aligned to the National Grid
- We used Stone Curlew data provided under licence by the RSPB to identify cells that were outside (but within 3km of the SPA boundary) and had held at least 5 nesting attempts (2011-2015 inclusive).
- These cells were buffered by 1500m.

4.12 We excluded any cells that were more than 3km from the SPA boundary as Stone Curlews are now more widely distributed across East Anglia and clearly at some point there

⁶ Some units within this SSSI are large, but are subdivided into compartments, and only those compartments with stone curlew nesting attempts were buffered – three compartments in total.

is potential that land is not functionally-linked to the Breckland SPA. The choice of 3km was made because most Stone Curlew activity is with 1km of the nest (Green, Tyler & Bowden 2000) and evidence indicates that development impacts occur over a 1500m distance, 3km should therefore adequately encompass the majority of birds' foraging requirements and absorb any impact of development. Radio-tracking (Green, Tyler & Bowden 2000) indicates a maximum home range of 3km and at distances beyond 3km it is suggested that risks would not be significant for the SPA population. The 3km distance is therefore suggested as the limit to which the mitigation requirements would apply and the limit to which any lower tier plan or project level HRA would need to be undertaken (notwithstanding the need to still assess impacts on Stone Curlew in order to fulfil other legislative and policy requirements in relation to wild birds).

4.13 We have chosen five nests within a 1km grid square to highlight areas that could be considered functionally linked to the SPA, i.e. habitat outside the SPA but performing a critical function to support the survival of the site interest feature. In order to provide meaningful guidance in policy, there is a need to identify what might constitute functionally linked land. However, there is a challenge in setting a particular threshold as Stone Curlews nest at low densities and may use individual fields infrequently, depending for example on crop type. There may be individual fields that have held multiple nesting attempts over the five years where the rest of the square is unsuitable, and therefore our threshold of five is not exceeded.

4.14 As such the use of our figure of five nests is a guide only and there may be areas outside the buffer that still warrant further checks and consideration at project level HRA It should not therefore be seen as an absolute minimum if there is evidence to suggest the land performs a supporting function. It is also a threshold that should not be used to inform purposes for which it was not intended. It is not, for example, a threshold to indicate habitat use or otherwise within the SPA, or for use with other SPA interest features.

4.15 A challenge with the definition of the secondary buffer is that survey coverage is incomplete. As described above the RSPB provided a GIS layer to which allowed us to identify areas with no survey coverage for the 2011-2015 period. Any grid cell (where at least part of that cell is within 3km of the SPA boundary) with less than 50% of the area covered by the RSPB survey coverage was identified.

Revised Map

4.16 The resulting map is shown in Map 2. The dark green solid shading shows the SPA and the red hatching around the SPA is the 1500m buffer (the primary buffer). Blue lines reflect the 'secondary' buffer – based on 1km cells that held at least 5 nesting attempts 2011-2015 and relates to cells within 3km of the SPA only. In addition, orange grid cells show areas where there are no or limited (less than half the area) survey data available from the RSPB. As the RSPB data is focussed on the key areas for Stone Curlews, some of these cells may contain unsuitable habitat. Only 1km cells where at least part of the cell is within

1500m of the SPA (with Stone Curlews) are shown. These orange cells therefore are ones where there are data gaps and additional data checks or survey data may be required to check for use by Stone Curlews.

4.17 The maps have therefore changed slightly since the previous maps included in the 2008 HRA for the Core Strategy; there are slight changes to both the primary and secondary buffer, and there is now the addition of the orange cells indicating a data deficit, which will need to be rectified at the project level. The most notable change is that some forestry blocks have been excluded when drawing the primary buffer, for example near West Stow, Bridgham/West Harling, south of Swaffham and by Northwold. These areas had previously been included because there were odd records of Stone Curlew nesting attempts in these areas. We suspect these may in some cases relate to birds nesting very close or on the boundary and the grid reference being slightly incorrect. The absence of records in the 2011-2015 data indicates it is appropriate to remove them.

Map 2: Stone Curlew buffers

- Breckland SPA
- 1500m buffer, SPA (with stone curlews)
- 1500m buffer for 1km cells outside SPA that hold 5+ nests, 2011-15
- 1km grid cells where less than half area surveyed

Incorporation of revised buffers within the Plan

4.19 The revised map and accompanying explanation/policy wording is included within the Plan. Policy ENV 3 explains the approach, and as explained in the previous section, has been the subject of revision between Footprint Ecology and Breckland Council, in order to fully reflect the findings and recommendations of this HRA.

4.20 These buffers should work such that:

There is a presumption against development within the 1500m primary buffer, because there is a good evidence base to conclude likely significant effects. It is further concluded that on the basis of evidence available at the plan level, adverse effects on site integrity cannot be ruled out. However, it is recognised from the evidence that there may be exceptions where further project level information, surveys and analysis could demonstrate that a development could proceed without adverse effects. The plan level evidence suggests that development could potentially be able to rule out adverse effects where:

- The development is fully within an existing urban area (i.e. high levels of existing housing) and is completely masked from the SPA on all sides (i.e. infill development);
- The development that is a re-development of existing building(s) and would not increase the existing footprint or intensity of use and potential detractors (such as noise, light, people);
- The development involves agricultural building of less than 120 sqm;
- The development involves an extension to existing agricultural buildings of less than 120 sqm or 100% of the original, whichever is less.

The secondary buffer identifies areas where we can be confident that the land is functionally linked to the SPA in terms of use by Stone Curlews, and the orange cells identify where there is a survey deficit and further information will therefore be required at the project level. Within the secondary buffer or in the areas identified where survey data are missing:

- Project level assessment will be required to rule out adverse effects on integrity, and this may include provision of mitigation measures to negate the loss or deterioration of functionally linked land as a result of the development; and
- Further survey work may be necessary.

4.21 Large developments adjacent to or just outside the primary or secondary buffer, particularly where occurring in an isolated area with few other buildings, are likely to also require project level assessment.

4.22 Policy ENV 03 addresses the Stone Curlew buffers and the revised buffers are included within the Plan. This policy wording reflects the evidence base and builds upon the policy wording first incorporated in the Core Strategy in 2008. As such adverse effects on integrity to the Breckland SPA as a result of avoidance of buildings by Stone Curlews can be ruled out with the application of all revised buffers and policy text. The environmental policies ENV 02 and ENV 03 have been considered in detail between Footprint Ecology and Breckland Council, and a set of revisions has been included in this report at Appendix 5.

4.23 It is noted from the screening of the plan for likely significant effects that a number of allocations are within areas of identified functionally linked/possible functionally linked land for Breckland SPA. The screening table at Appendix 4 highlights where text therefore needs to be added to make clear that there will be survey and mitigation requirements in these areas, and a project level HRA may or may not be able to rule out adverse effects on site integrity, depending on the suitability of mitigation proposed.

4.24 In updating and finalising this HRA report for the Publication version of the Breckland Local Plan, a full check of the Local Plan has been undertaken again. Recommendations made in the likely significant effects table at Appendix 4 in relation to bird disturbance and the recommendations for revising policies ENV2 and ENV3 and their supporting text have been fully incorporated. The appropriate assessment at plan level for assessing potentially reduced densities of key bird species in relation to urban development can conclude that adverse effects have been prevented with the measures incorporated, and the ongoing work that the Council will do to progress implementation of measures, working with other partners and stakeholders.

5. Appropriate assessment - urban effects (including recreational disturbance)

5.1 By 'urban effects' we refer to a range of impacts such as disturbance to Annex I bird species, eutrophication (e.g. from dog fouling), trampling, increased fire risk, habitat damage from recreational use such as biking, off-road vehicles etc, introduction of alien plants, litter, fly-tipping, predation from cats etc. Proximity to urban centres and high population pressure means these impacts are all exacerbated and as a result, particular management measures are often required. Furthermore, with growing urbanisation, sites are at risk of becoming isolated and fragmented, leading to long terms risks of species loss and inability for species to recolonise.

5.2 Impacts of disturbance for Woodlark and Nightjar are well documented (Murison 2002; Liley *et al.* 2006; Mallord *et al.* 2007). There are also a range of reviews and other relevant work on urban effects (Underhill-Day 2005; Chace & Walsh 2006; Mcdonald, Kareiva & Forman 2008; Mcdonald *et al.* 2009; Hall *et al.* 2016).

5.3 The issues relate to the Breckland SAC and Breckland SPA interest, and also to the Norfolk Valley Fens SAC (see Table 3 for summary). Further background to the issues relating to urban effects can be found in the previous Habitats Regulations Assessment work relating to the Core Strategy and to the Thetford Area Action Plan (Liley *et al.* 2008; Liley & Tyldesley 2011).

5.4 We include disturbance to birds here, rather than as a separate section (in contrast to earlier assessment work, such as the Core Strategy). In setting out a logical appropriate assessment of potential impacts arising from growth in Breckland, the consideration of all urban effects together seems most appropriate. The avoidance of buildings by Stone Curlew is however considered separately as the distances involved, habitats (agricultural land with no access) and other issues are unique to that species. Also, closely linked to 'urban effects' are air quality and hydrological issues such as run-off; these are considered as subsequent appropriate assessment sections.

Table 3: Summary of urban effects and relevance to particular European sites

Breckland SAC	Breckland SPA	Norfolk Valley Fens
		Eutrophication (e.g. dog fouling)
		Trampling
		Habitat damage from recreation
		Introduction/spread of alien plants
		Litter/fly tipping

5.5 In the previous iterations of the HRA (e.g. Preferred Directions), options were mapped and checked as to whether any of the directions for development lie adjacent to the relevant European sites. We identified a number of sites within 400m of relevant European site boundaries and these have now been filtered out of the plan. The choice of 400m was a pragmatic one. A zone of 400m has been used in other areas (for example the East Devon Pebblebed Heaths, the Dorset Heaths and the Thames Basin), with the 400m selected as a distance at which the impacts from built development, and some urban effects cannot be mitigated for. The use of a 400m distance is also referred to in the Breckland Core Strategy and discussed within both the Core Strategy and Thetford Area Action Plan Habitats Regulations Assessments (Liley et al. 2008; Liley & Tyldesley 2011). Development options beyond 400m may also have impacts through urban effects, but 400m is a useful measure to identify locations where development may be unable to proceed and where particular concerns may be triggered.

5.6 Cumulate effects will relate to the overall scale of growth around the European sites. The overall level of growth (15,297 dwellings) is marked and will occur in a relatively short time period (2011 - 2036), with an anticipated rate of 612 new dwellings per annum. The figures in the Plan given within the spatial portrait suggest an increase in population from 131,857 people in 2012 to 153,678 people in 2036, an increase of around 17%. GIS data from 2016 indicates around 59,500 residential delivery points within Breckland District. At a rate of 612 dwellings per year, 12,852 new dwellings would therefore be expected to be built through to 2036, an increase of over 20% in the number of dwellings.

5.7 Previous assessment work (Liley et al. 2008) reviewed visitor survey results from Breckland and highlighted the large and relatively contiguous area of forest and heath with current access and the relatively small human population resident in Breckland. This represents a marked contrast to some other areas such as the Thames Basin Heaths and Dorset Heaths where fragments of heathland occur surrounded by housing and urban environments. It is therefore perhaps not surprising that among the range of studies of Nightjar or Woodlark and disturbance in the UK, work from Thetford Forest is one of the few studies to have found no current impacts from recreation (see Preferred Directions HRA for detail of references and studies reviewed).

5.8 The scale of change within Breckland is such that there will be growing pressure for recreation within the Breckland SPA/ SAC and at some point in the future it is possible that impacts may occur. The emerging visitor survey results from the Norfolk wide surveys highlight the scale of change in access that is likely. The survey results were used to make predictions of the scale of change as a result of new housing in the current plan period. The predicted increase was most marked in the Brecks compared to all the other European sites considered in the report. At the surveyed locations within Breckland the results suggested an increase in visitor use of around 30% as a result of future housing (in the current plan period) within Norfolk. The large increase is due to the large increases in housing within relatively close distances.

5.9 Breckland Council, as a competent authority under the Habitats Regulations, should seek to put in place measures to maintain sites and prevent their decline. To allow decline and then

seek to rectify it is not in accordance with the objectives of the legislation and the purpose of the European site network. Long term monitoring of recreation levels and potential for urban effects is therefore relevant and important for Breckland Council to establish as an early warning mechanism, to ensure that site integrity continues to be maintained and that conservation objectives for the site are not affected.

5.10 In line with previous assessment work and the Breckland Core Strategy, it needs to be recognised that whilst significant issues in relation to recreation disturbance are not currently evident, there is a requirement to maintain interest features and prevent deterioration. This therefore means recognising interest feature sensitivities and the nature of future growth, which may otherwise lead to harm to the SPA if evidence is not continually checked and preventative measures are not in place.

5.11 At a point where levels of access are sufficient to raise concerns, prior to any actual deterioration, mitigation will need to be secured for development. Mitigation would include measures to keep dogs on leads, raise awareness among visitors of the conservation importance of sites they are visiting and to provide alternative (less sensitive) sites and routes as relevant. Further discussion is provided in Liley et al (2008; see sections 12.3 and 12.4). Previous planning policy in the Core Strategy committed to recreation management, monitoring and mitigation in collaboration with partners. It is recommended that these commitments are reiterated again in the new emerging Local Plan, and that clarity is given as to the approach to be taken for monitoring, relevant partners involved, and importantly, when that will be implemented.

5.12 Following on from Core Strategy recommendations in this regard, which to date have not been fully progressed, it is recommended that

- a framework committed to within Policy ENV 3 for working with relevant partners to protect and restore the most urban heath sites, with a requirement for developers to contribute to measures within the framework where development may lead to increased recreation use of urban heaths.
- adequate recreation provision is secured within new development that might otherwise increase recreation pressure, particularly at accessible forest sites. Breckland Council should work with partners to appropriately manage recreation, again particularly at accessible forest sites.

5.13 These commitments should be included in ENV 3. Appendix 5 shows recommended revisions to policy ENV 3 as part of this HRA report.

5.14 In updating and finalising this HRA report for the Publication version of the Breckland Local Plan, a full check of the Local Plan has been undertaken again. Recommendations made in the likely significant effects table at Appendix 4 in relation to urban effects and recreation disturbance, and the recommendations for revising policies ENV2 and ENV3 and their supporting text have

been fully incorporated. The appropriate assessment at plan level for assessing urban effects and recreation disturbance can now conclude that adverse effects have been prevented with the measures incorporated and the ongoing work that the Council will do to progress implementation of measures, working with other partners and stakeholders. The latter is particularly relevant for the development of the mitigation programmes/framework now referred to within policy ENV3.

Additional measures in sensitive areas of focussed growth (Thetford, Swaffham, Mundford).

5.15 The recent additional evidence gathering in conjunction with Norfolk local planning authorities (Panter, Liley & Lowen 2017), indicates that additional growth at Thetford, Swaffham and Mundford could result in more significant recreation impacts, given the current visitor use from these settlements and their proximity to Breckland SPA/SAC. In light of this new research it is recommended that Policy ENV 03 should include a requirement for additional focussed measures at Thetford, Swaffham and Mundford. These measures should be developed by the Council and partners to effectively advise project level HRAs. It is suggested that a prescriptive strategic approach is not required at this point in time, but rather the Council should look to ensure that mitigation measures are co-ordinated to achieve maximum benefits and European site protection.

5.16 As noted above, recommendations made in the likely significant effects table at Appendix 4 in relation to urban effects and recreation disturbance, and the recommendations for revising policies ENV2 and ENV3 and their supporting text have now been fully incorporated within the Publication version of the plan. This includes, where required, reference to measures at Thetford, Swaffham and Mundford.

6. Air quality

6.1 Airborne nitrogen (mostly as ammonia and nitrous oxides) from burning fossil fuels by industry, traffic, shipping and agriculture, can have marked impacts for nature conservation sites. Habitats such as heathlands are low nutrient systems with poor buffering capability against inputs of nutrients (mostly airborne nitrogen) or increases in acidity (mostly a side effect of nitrogen or from airborne sulphur).

6.2 Many specialist plant species, particularly those associated with heathland and grassland habitats, can only survive and compete successfully on soils with low nitrogen availability (Bobbink & Heil 1993). The addition of nitrogen in rain or dust particles, results in an increase in the nitrogen in the vegetation, litter and upper soil layers, and this builds up over time. Impacts have been detected on heathland within 200m of roads (Angold 1997).

6.3 There is a challenge in resolving air quality impacts as the issues relate to a wide variety of potential sources and long-term changes in vegetation that can be difficult to pin-point or record.

6.4 In Map 3 we show the distribution of all major roads within and around Breckland District. From this we can highlight the following roads running within 200m of SAC sites where air pollution from atmospheric nitrogen has been identified by Natural England as a current threat or pressure in the site improvement plan (Breckland SAC⁷, Norfolk Valley Fens⁸ and Waveney & Little Ouse Valley Fens⁹):

- A1065 Breckland
- A47(T) Norfolk Valley Fens
- A1075 Norfolk Valley Fens
- A134 Breckland
- A11(T) Breckland
- A1075 Breckland
- A1066 Waveney & Waveney & Little Ouse Valley Fens
- A11(T) Norfolk Valley Fens
- B1146 Norfolk Valley Fens
- B1135 Norfolk Valley Fens
- B1107 Breckland
- B1108 Breckland
- B1111 Norfolk Valley Fens
- B1113 Waveney & Little Ouse Valley Fens

⁷ <http://publications.naturalengland.org.uk/publication/5075188492271616>

⁸ <http://publications.naturalengland.org.uk/publication/6261291761008640>

⁹ <http://publications.naturalengland.org.uk/publication/5465193064693760>

6.5 Following a recent High Court decision relating to Ashdown Forest¹⁰ there is now some uncertainty over the correct approach to assessment of plans or projects with air quality impacts. The High Court's decision criticised the advice that Natural England (and by analogy others e.g. the Environment Agency) had given about there being no need to carry out an express "in combination assessment" in relation to plans and projects which, alone, have air quality impacts falling below a particular threshold.

6.6 Protecting, maintaining and restoring European wildlife sites should not be reactive when there are clear indicators of deterioration. Rather, the legislation and NPPF policy in relation to the environment indicates that it is in integral part of sustainable development and an ongoing area of work. The objectives of the European Directives are to maintain European site interest, and restore where there is existing deterioration. It follows therefore that putting in place checks to avoid deterioration, or gathering further evidence to inform future action if necessary, is a meaningful measure to achieve these objectives.

6.7 It is recommended that Breckland Council reviews current air quality monitoring and the triggers for requesting air quality assessments as part of planning applications, to determine whether this adequately protects sites from air quality impacts. The plan does not specifically include an air quality policy. Recommendations therefore need to be taken forward by the Council as part of their duties to meet the objectives of the legislation.

6.8 For this Local Plan HRA, the recommendations made here are not currently a matter requiring a strategic approach within the Local Plan at this stage, but rather it is an aspect of European site protection that warrants further attention through checking that the right processes, underpinned by the right evidence, are in place. Map 3 should assist Breckland Council in determining the locations where large-scale developments leading to increases in traffic volumes on roads within 200m of European sites would need to provide traffic and air quality assessments.

6.9 Specific air quality considerations need to be given when road improvements are necessary. The plan refers to A11 and A47 dualling, with the A11 dualling now complete. Further improvements to the A11 are proposed as part of the Thetford SUE, currently with outline permission pending finalisation of the S106. The legal agreement is not yet finalised because there are a number of outstanding matters in relation to the European site mitigation. Until these are resolved and there is confidence that the measures are secured, fit for purpose and will be implemented in a timely way to prevent adverse effects, the S106 cannot be finalised. Dualling of the A47 is already in place in some stretches, including those closest to Breckland SPA/SAC. However, there is a risk that some of the improvement works to the A47 could come in close proximity to forested parts of the SPA, and therefore potentially affect nightjar and woodlark and their functionally linked habitat, or could affect stone curlew functionally linked land. These

¹⁰ Wealden District Council v Secretary of State for Communities and Local Government, Lewes District Council and South Downs National Park Authority [2017] EWHC 351

potential risks should be capable of mitigation, but it is recommended that early consideration of survey needs and potential mitigation land requirements, will need to be factored in to project options and appraisal, before detailed designs are embarked upon. The likely significant effects table makes recommendations for text additions to this effect, with reference to preparing for project level HRA.

6.10 In updating and finalising this HRA report for the Publication version of the Breckland Local Plan, a full check of the Local Plan has been undertaken again. Recommendations made in the likely significant effects table at Appendix 4 in relation to air quality and transport/traffic have been fully incorporated. There is now reference to the need for early evidence gathering for transport schemes. The appropriate assessment at plan level for assessing air quality can now conclude that adverse effects have been prevented with the measures incorporated.

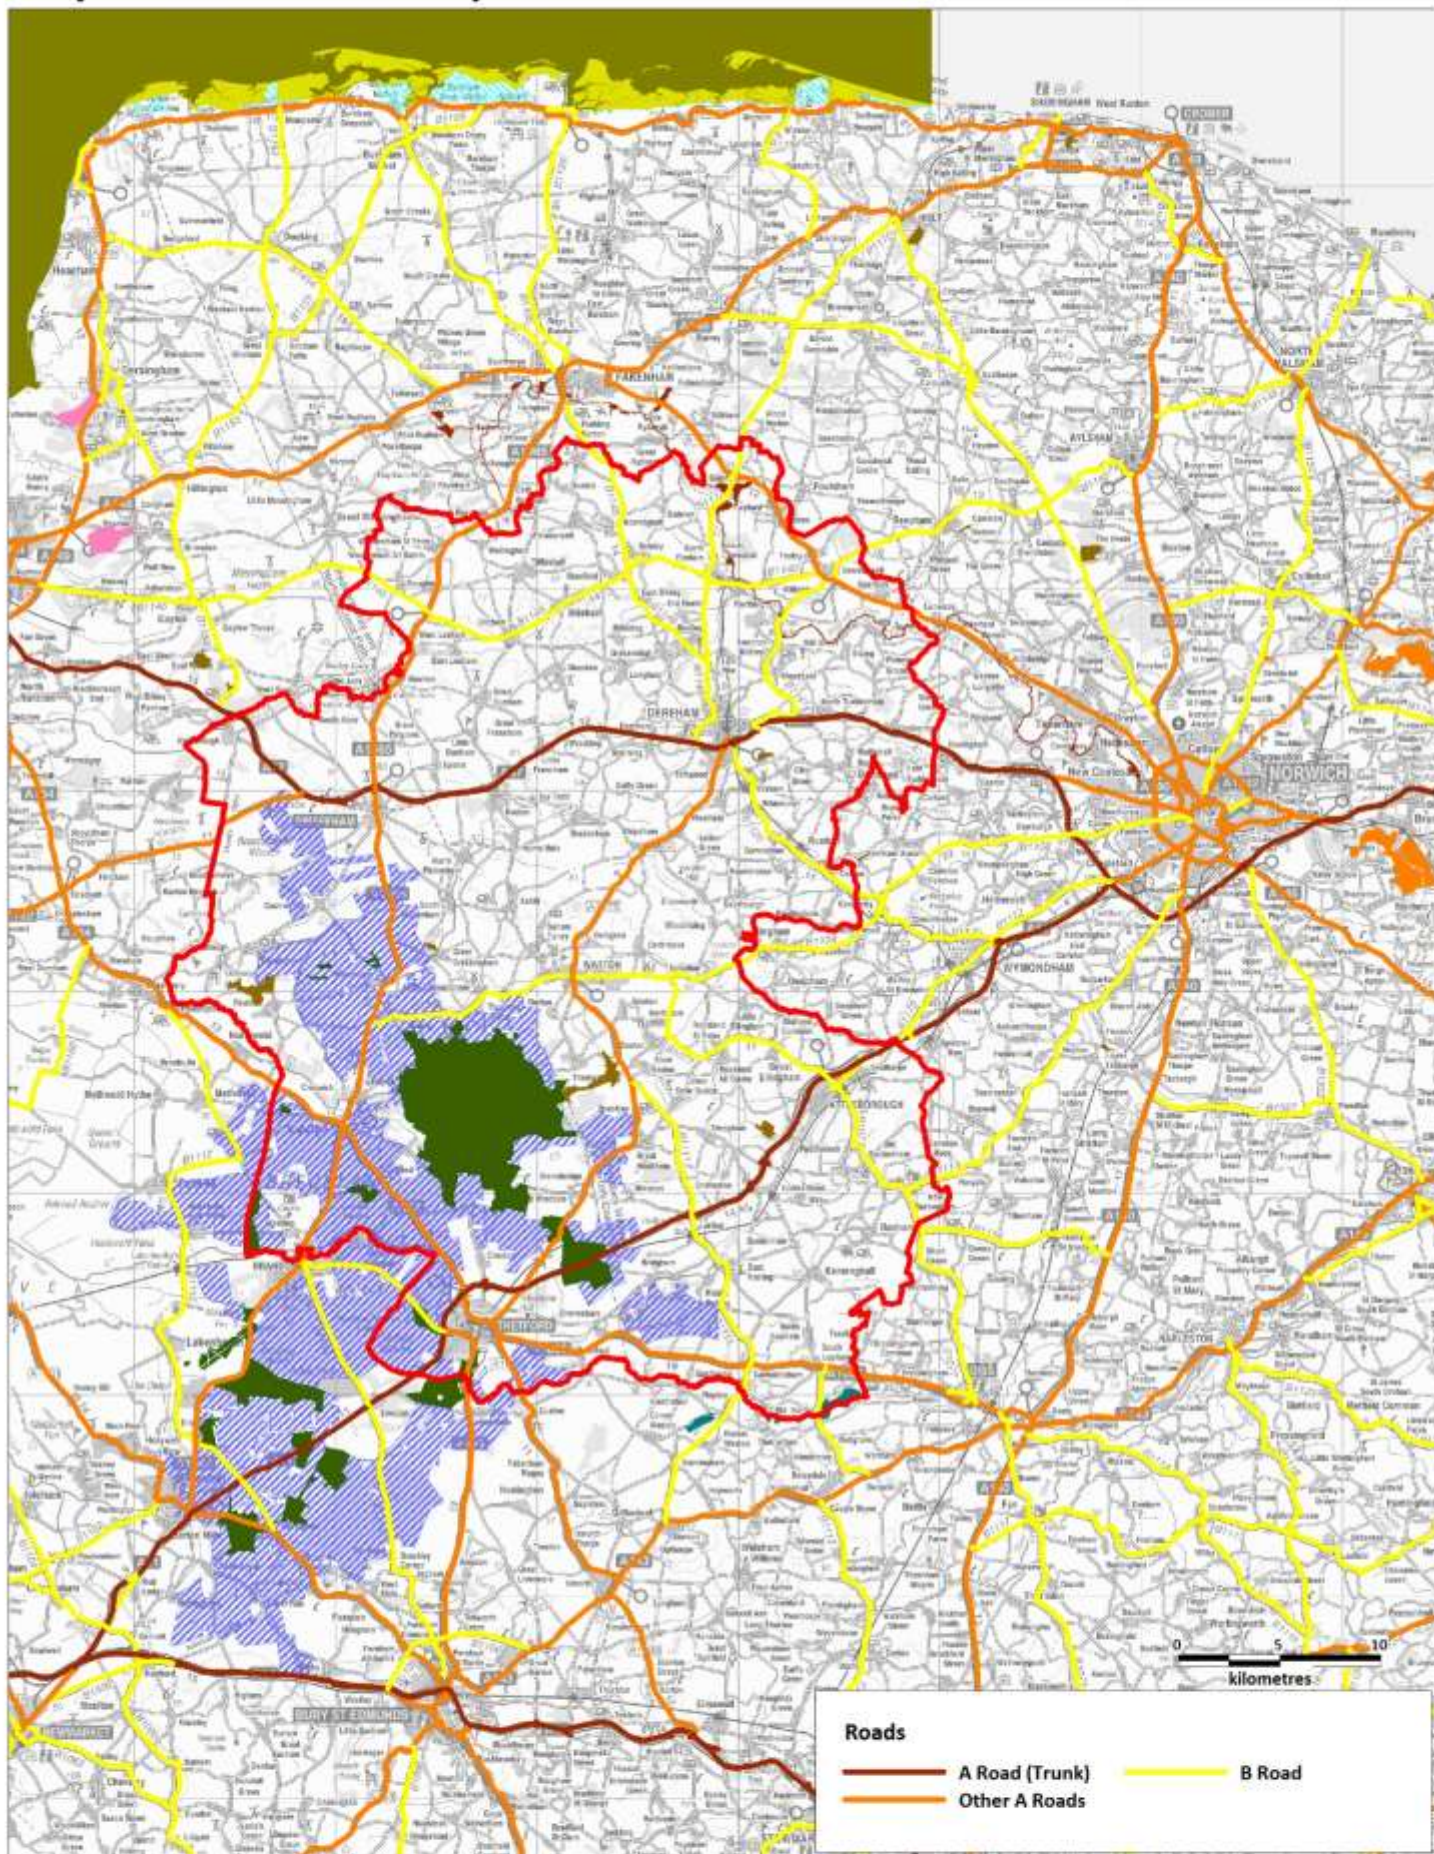

Effects of roads and traffic on Stone Curlew

6.11 A range of studies have shown that Stone Curlew avoid nesting close to roads (Day 2003; Sharp *et al.* 2008; Clarke & Liley 2013). The most recent study (Clarke & Liley 2013) found lower nest densities on arable land close to trunk A roads and within 500m of the road in particular. Findings from previous studies (e.g. Sharpe *et al.* 2008) indicate that it is the volume of traffic along the roads that is the key measure relating to the avoidance of the land near roads.

6.12 The recommended measures remain consistent with Core Strategy HRA, which are that no road improvements should be promoted within 200m of Breckland SAC, and within 1500m of Breckland SPA. This should be reflected in the Local Plan supporting text for transport.

6.13 As above, in updating and finalising this HRA report for the Publication version of the Breckland Local Plan, a full check of the Local Plan has been undertaken again, and it is noted that reference is made within supporting text for the transport section of the Local Plan to the 200m and 1500m zones.

Map 3: Roads and European Sites

7. Water supply, water quality and waste water discharge, flood risk

7.1 Issues relating to water that pose potential risks to European sites include flood risk, deterioration of water quality, reduced water resources, alterations to river flow, and changes to hydrological processes.

7.2 Previous Habitats Regulations Assessment work for the documents within the Local Development Framework identified the need for precautionary progression of housing delivery up to the previous plan period end of 2026, to ensure that water issues did not pose a risk to European sites. The Core Strategy provided this security in policy wording that required a stepwise approach to bringing housing forward, in line with gathering certainty from new evidence over time that is necessary to demonstrate that the full quantum of housing could be delivered without adverse effects.

7.3 Sites with a sensitivity to water quality and resource changes are:

- Breckland SAC (includes the fluctuating water bodies fed by ground water from the chalk aquifer, water availability will be critical for these features)
- Norfolk Valley Fens SAC (water availability, flooding, water quality and changes to hydrology have the potential to fundamentally affect these relatively isolated fen sites)
- River Wensum SAC (water availability, flooding, water quality and changes to hydrology have the potential to fundamentally affect the interest of the river)

7.4 The Norfolk Valley Fens SAC is a European site made up of a number of isolated fen fragments. As shown on Map 1, there are a number of SAC fragments in close proximity to potential housing allocations (as previously described, these are the reasonable and unreasonable alternatives). Of particular note is potential housing allocations at Attleborough and Dereham. Some of these sites have also been discussed in earlier sections of the appropriate assessment in relation to urban effects.

7.5 Natural England has advised Footprint Ecology that there are potential concerns with regard to isolation, run-off and water abstraction in relation to the Norfolk Valley Fens SAC, and run off in particular is a focus of Natural England's programme of site improvements. These issues therefore need to be considered with the key evidence documents for water; the Water Cycle Study prepared by Breckland Council and the Flood Risk Assessment work undertaken by the County Council. It will be important to consider hydrological connections within the catchment of each fen, as part of the Water Cycle Study.

7.6 The proposed Attleborough SUE has been a priority for housing delivery over a number of years, and the Council has worked with the developer to bring forward a suitable development

proposal, which was the subject of an Environmental Impact Assessment (EIA) Scoping Report in March 2015, and an application is now in the final stages of preparation, with a full Environmental Statement to be submitted alongside the application. The EIA should provide an in-depth assessment of the environmental impacts of the proposed large urban extension at this location. It is imperative that the Council ensure that the Environment Statement includes adequate consideration of potential effects on European sites, including all potential risks detailed in the appropriate assessment chapters of this report.

Water Cycle Study

7.7 The Breckland Water Cycle Study was produced in 2 phases, with a Phase 1 Outline Study undertaken 2008, and then a Phase 2 detailed study was completed in May 2010. The Water Cycle Study work set out the detailed solutions required for delivering growth for the specific development allocations, including detailed information on the cost of the infrastructure and timing of the required works necessary to deliver sustainable water supply and waste water treatment. Specific requirements, such as the need for a new mains sewer for Thetford, were identified.

7.8 Now that the Local Development Framework has partially delivered its housing target, and a new Local Plan is being prepared, it is necessary to revisit the available evidence to determine whether the new quantum and pace of growth proposed by the new Local Plan can be sustained in terms of water supply and water treatment and management, without risking adverse effects on any European site, or without impeding the delivery of conservation objectives to restore any European site.

7.9 A Water Cycle Study update has now been prepared to cover the potential implications of increased discharge of treated water from waste water treatment works, in terms of impacts on flow and water quality. With revised growth and new site allocations in 2016, an update to the assessment of water environment and water infrastructure provision was required, taking into account differences in growth targets and locations as well as changes in infrastructure capacity and planning to that assessed in 2010. The Water Cycle Study update provides an updated assessment for this purpose.

7.10 The revised Water Cycle Study for 2017 specifically considers the issues for Attleborough SUE, where it is recognised that the Waste Water Treatment Works (WWTW) would require the implementation of new and improved treatment technologies to ensure that water can continue to meet the required legislative targets. The study further states that Anglian Water Services are progressing trials to inform the necessary upgrades in the next water company investment period (2020 to 2025), therefore securing the necessary measures to protect the natural environment. Reference is made within the Attleborough SUE policy and supporting text, and also the forthcoming Infrastructure Delivery Plan, for a threshold of housing delivery, beyond which cannot be accommodated without further upgrades.

7.11 For Dereham, the updated study advises that continued management of treatment headroom is required through several measures including: reducing water use within the existing property in the town; and, monitoring changes in occupancy rate. The study advises that if headroom is exceeded, enhanced treatment technologies as proposed for Attleborough would be considered to ensure downstream water quality targets are met. This is also supplemented with a recommendation for proposals to request information on headroom capacity. These solutions pose some risks if not managed in a timely manner. Headroom should not be exceeded, rather there should be additional monitoring and close accounting of development coming forward, to ensure that headroom is not breached.

7.12 The update to the study goes on to advise that the planned phasing of growth in Dereham needs to be part of ongoing discussions between relevant bodies. Policy wording needs to make clear the need for further work and consideration of phasing development, dependent upon the specific solution identified.

7.13 All housing allocations in the plan have policy text relating to the need to make a pre-development enquiry. This needs to be changed to a pre-application enquiry. If a development has permission, the water utility company is obliged to secure water resource and treatment facilities, so this text does not offer protection and these issues require early warning and early implementation of solutions.

7.14 For water supply, the Water Cycle Study update indicates that the level of growth within the Local Plan is factored into the current Anglian Water Services Water Resources Management Plan, which has been approved by the Environment Agency and Defra. The update therefore concludes that a sufficient sustainable water supply is available to meet planned demand without impacting adversely on the environment. However, the study does note the potential need for a winter storage reservoir in the Norfolk Fens in the longer term. This will need early consideration in terms of European site impacts, in order for it to be relied upon as a solution to support future growth.

7.15 In updating and finalising this HRA report for the Publication version of the Breckland Local Plan, a full check of the Local Plan has been undertaken to confirm that recommendations made in relation to water issues have been fully incorporated. This appropriate assessment can therefore conclude that adverse effects on European sites are prevented at the plan level by the modifications made.

Flood Risk Assessment Update

7.16 The update, as with the Water Cycle Study update, informs the preparation of the new Local Plan. Whilst recognising that the County Council is the Lead Local Flood Authority, the update gives clear recommendations for policy improvements and strengthening within the Breckland Local Plan, as follows:

- Seeking Flood Risk Reduction through Spatial Planning and Site Design
- Reducing Surface Water Runoff from New Developments

- Enhancing and Restoring the River Corridor
- Protecting and Promoting Areas for Future Flood Alleviation Schemes
- Improving Flood Resilience and Emergency Planning

7.17 Some of these relate to the maintenance and restoration of the natural environment, but are not fully integrated into Policy ENV 09. Additional text in relation to enhancing and restoring the river corridor and protecting future areas for sustainable flood management should be added, noting that some of this work will be with neighbouring authorities and the County Council as Lead Local Flood Authority. In re-checking the Breckland Local Plan at its final Publication version, it is noted that these amendments have now been made.

8. Conclusions

8.1 A comprehensive set of text modifications have been recommended in the screening for likely significant effects table at Appendix 4. The appropriate assessment sections add to these recommendations and make further proposals for strengthened or modified mitigation, including text revisions for environmental policies ENV 02 and 03 in Appendix 5, and a number of additional actions in relation to implementing mitigation measures, that the Council needs to progress as a priority.

8.2 Forthcoming additional plans and strategies, such as the Infrastructure Delivery Plan and Attleborough Masterplan (prepared by the developer) should demonstrate conformity with this HRA. Where required, they should seek to embed mitigation measures to secure their implementation, particularly in relation to key themes such as transport and water treatment. Attleborough is the subject of its own Neighbourhood Plan, with accompanying HRA. Cross reference with this HRA is advised.

8.3 The recommendations are extensive, but are comprehensive enough to give certainty that the plan will not adversely affect European sites. Footprint Ecology has been working with the Council as the HRA report has been developed, to capture the necessary actions to progress in terms of the measures to develop with partners, further evidence needs and monitoring requirements.

8.4 The recommendations of this HRA report have now been considered by the Council and the Publication version of the plan finalised with all recommendations made in this HRA report now embedded. This HRA has subsequently been updated again, having now re-checked the following impacts from the plan and resultant potential effects:

8.5 **Reduced bird densities as a result of disturbance** – Recommendations now fully incorporated, including the new Stone Curlew buffer map and a revised policy ENV3 in accordance with recommendations made in Appendix 5 of this HRA report.

8.6 **Urban effects and recreation pressure** – Recommendations now fully incorporated, particularly in ENV3 in relation to progressing mitigation measures previously required for the Core Strategy HRA. The necessary work programmes/frameworks need to be progressed by the Council in partnership with others.

8.7 **Air Quality** – Changes recommended for supporting text now fully incorporated in relation to early evidence gathering for road schemes. In addition to plan level measures, this HRA also recommends that Breckland Council reviews current air quality monitoring and the triggers for requesting air quality assessments as part of planning applications, to ensure that current processes adequately protect sites from air quality impacts.

8.8 **Water issues for Attleborough** – The updated Water Cycle Study identifies the need for new and improved treatment technologies for the WWTW that will serve the Attleborough SUE,

which are to come forward between 2020 and 2025. Phased development is therefore set out within the plan and also the forthcoming Infrastructure Delivery Plan. In taking forward the planning application for the SUE, the Council will need to check that the Environment Statement includes adequate consideration of potential effects on European sites, having regard for all potential risks detailed in the appropriate assessment chapters of this report. This should include assessing potential impacts on the fragmented sites of the Norfolk Valley Fens SAC, which are in close proximity.

8.9 Water issues for Dereham - The recommendation to require a pre-application enquiry with the relevant water utility company has now been added to the plan. Previously the plan required a pre-development enquiry, which did not allow for issues to be resolved to inform the project level HRA for the planning permission being given.

8.10 Water supply - It should be noted that the Water Cycle Study advises on the potential need for a winter storage reservoir in the Norfolk Fens in the longer term. This needs to be the subject of ongoing review by the Council as the Local Plan is implemented and future Local Plan Reviews are instigated.

8.11 Flood Risk - Policy ENV 09 has now been amended to refer to enhancing and restoring the river corridor and protecting future areas for sustainable flood management.

8.12 The plan and this HRA report are now considered to be fully compliant with the Habitats Regulations and can be provided to the Planning Inspectorate for Examination. This HRA report is now finalised and able to confirm that adverse effects on site integrity have been ruled out by the changes made. Natural England's comments will also be necessary to inform the Examination and demonstrate that the Local Plan is considered sound in terms of its protection of European sites and adherence to the Habitats Regulations

10. Appendix 1: HRA process

- 10.1 The designation, protection, restoration and enhancement of European wildlife sites is embedded in the Conservation of Habitats and Species Regulations 2010, as amended, which are commonly referred to as the 'Habitats Regulations.' Recent amendments to the Habitats Regulations were made in 2012.
- 10.2 The Habitats Regulations are in place to transpose European legislation set out within the Habitats Directive (Council Directive 92/43/EEC), which affords protection to plants, animals and habitats that are rare or vulnerable in a European context, and the Birds Directive (Council Directive 2009/147/EC), which originally came into force in 1979, and which protects rare and vulnerable birds and their habitats. These key pieces of European legislation seek to protect, conserve and restore habitats and species that are of utmost conservation importance and concern across Europe. Although the Habitats Regulations transpose the European legislation into domestic legislation, the European legislation still directly applies, and in some instances, it is better to look to the parent Directives to clarify particular duties and re-affirm the overarching purpose of the legislation.
- 10.3 Since the Government commenced with the processes necessary for the UK to leave the European Union, it has been recognised that much of our domestic law originates in European Directives. The Great Repeal Bill is an important part of the exit process, and once in force it will secure all enactments currently in force under EU law that are relevant to the UK as domestic legislation. This then retains all such legislation until or unless specifically repealed. The Habitats Directive and Wild Birds Directive will therefore be retained and applied after the UK leaves the European Union.
- 10.4 European sites include Special Areas of Conservation (SACs) designated under the Habitats Directive and Special Protection Areas (SPAs) classified under the Birds Directive. The suite of European sites includes those in the marine environment as well as terrestrial, freshwater and coastal sites. European sites have the benefit of the highest level of legislative protection for biodiversity. Member states have specific duties in terms of avoiding deterioration of habitats and species for which sites are designated or classified, and stringent tests have to be met before plans and projects can be permitted, with a precautionary approach embedded in the legislation, i.e. it is necessary to demonstrate that impacts will not occur, rather than they will. The overarching objective is to maintain sites and their interest features in an ecologically robust and viable state, able to sustain and thrive into the long term, with adequate resilience against natural influences.
- 10.5 Where sites are not achieving their potential, the focus should be on restoration. Article 10 of the Habitats Directive particularly encourages land use planning policies to endeavour to improve the European site network by managing the landscape for

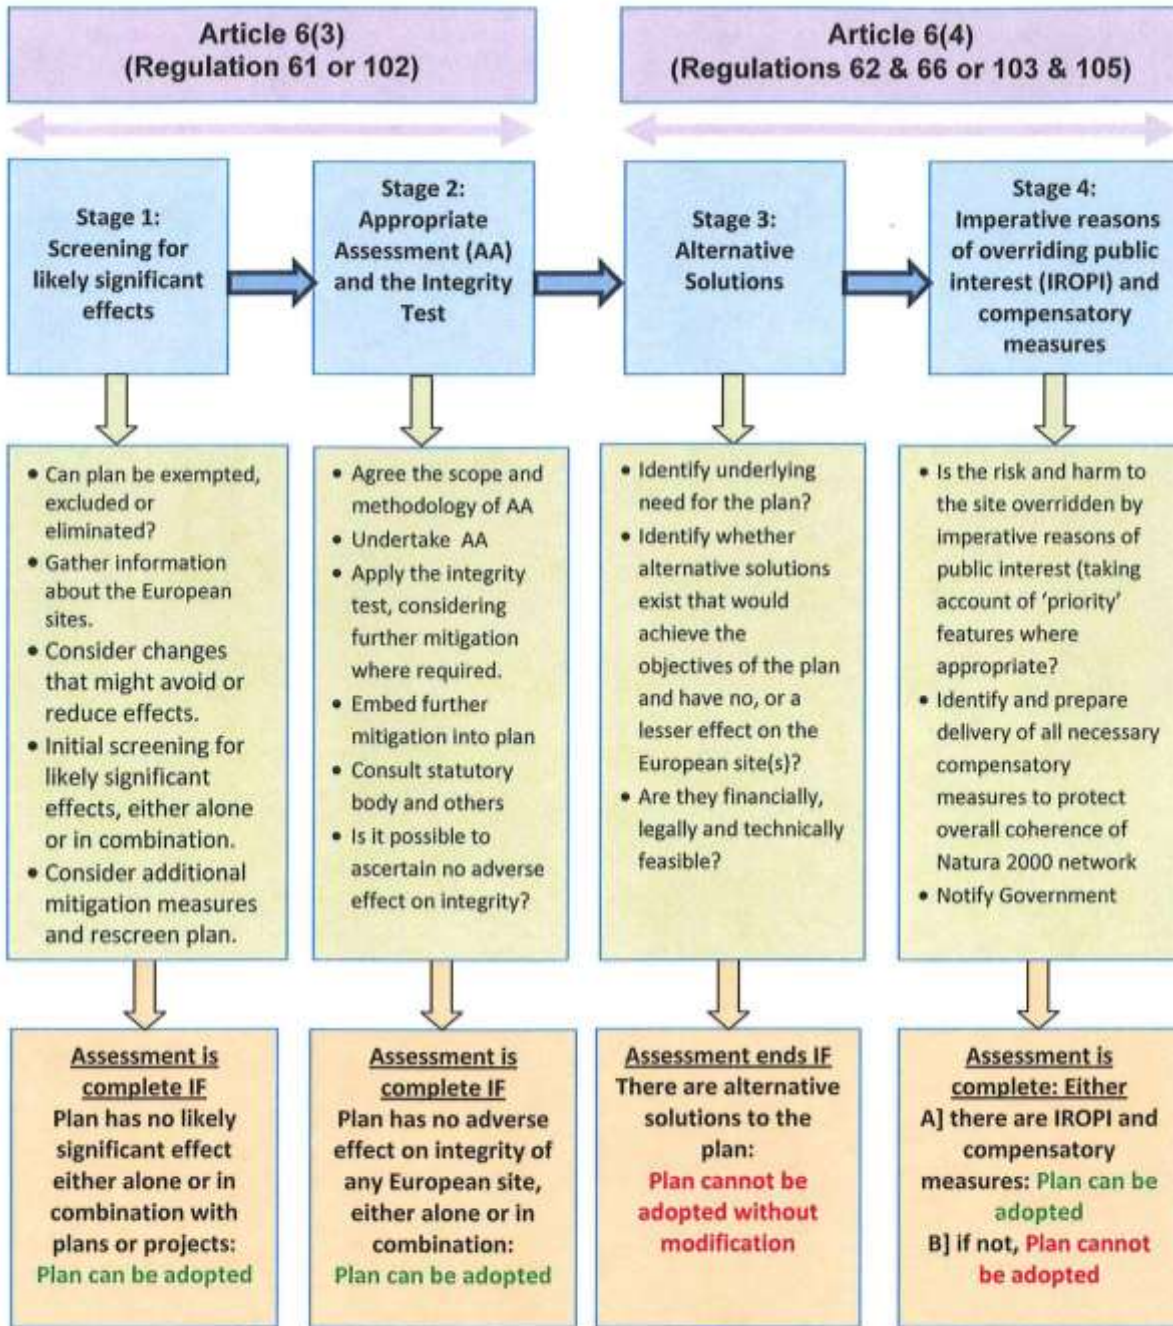

the benefit of wild flora and fauna, therefore encouraging an approach that secures coherence of the network through beneficial management that does not stop at site boundaries.

- 10.6 The UK is also a contracting party to the Ramsar Convention, which is a global convention to protect wetlands of international importance, especially those wetlands utilised as waterfowl habitat. In order to ensure compliance with the requirements of the Convention, the UK Government expects all competent authorities to treat listed Ramsar sites as if they are part of the suite of designated European sites, as a matter of government policy, as set out in Section 118 of the National Planning Policy Framework. Most Ramsar sites are also a SPA or SAC, but the Ramsar features and boundary lines may vary from those for which the site is designated as a SPA or SAC.
- 10.7 It should be noted that in addition to Ramsar sites, the National Planning Policy Framework (NPPF) also requires the legislation to be applied to potential SPAs and possible SACs, and areas identified or required for compensatory measures where previous plans or projects have not been able to rule out adverse effects on site integrity, yet their implementation needs meet the exceptional tests of Regulation 62 of the Habitats Regulations, as described below.
- 10.8 The step by step process of HRA is summarised in the diagram below. Within the Habitats Regulations, local planning authorities, as public bodies, are given specific duties as ‘competent authorities’ with regard to the protection of sites designated or classified for their species and habitats of European importance. Competent authorities are any public body individual holding public office with a statutory remit and function, and the requirements of the legislation apply where the competent authority is undertaking or implementing a plan or project, or authorising others to do so. Regulation 61 of the Habitats Regulations sets out the HRA process for plans and projects, which includes development proposals for which planning permission is sought. Additionally, Regulation 102 specifically sets out the process for assessing emerging land use plans.
- 10.9 The step by step approach to HRA is the process by which a competent authority considers any potential impacts on European sites that may arise from a plan or project that they are either undertaking themselves, or permitting an applicant to undertake. The step by step process of assessment can be broken down into the following stages, which should be undertaken in sequence:
- Check that the plan or project is not directly connected with or necessary for the management of the European site
 - Check whether the plan or project is likely to have a significant effect on any European site, from the plan or project alone

- Check whether the plan or project is likely to have a significant effect on any European site, from the plan or project in-combination with other plans or projects
- Carry out an 'appropriate assessment'
- Ascertain whether an adverse effect on site integrity can be ruled out.

- 10.10 Throughout all stages, there is a continual consideration of the options available to avoid and mitigate any identified potential impacts. For projects, the project proposer may identify potential issues and incorporate particular avoidance measures to the project, which then enables the competent authority to rule out the likelihood of significant effects. A competent authority may however consider that there is a need to undertake further levels of evidence gathering and assessment in order to have certainty, and this is the appropriate assessment stage. At this point the competent authority may identify the need to add to or modify the project in order to adequately protect the European site, and these mitigation measures may be added through the imposition of particular restrictions and conditions.
- 10.11 For plans, the stages of HRA are often quite fluid, with the plan normally being prepared by the competent authority itself. This gives the competent authority the opportunity to repeatedly explore options to prevent impacts, refine the plan and rescreen it to demonstrate that all potential risks to European sites have been successfully dealt with.
- 10.12 When preparing a plan, a competent authority may therefore go through a continued assessment as the plan develops, enabling the assessment to inform the development of the plan. For example, a competent authority may choose to pursue an amended or different option where impacts can be avoided, rather than continue to assess an option that has the potential to significantly affect European site interest features.
- 10.13 After completing an assessment, a competent authority should only approve a project or give effect to a plan where it can be ascertained that there will not be an adverse effect on the integrity of the European site(s) in question. To reach this conclusion, the competent authority may have made changes to the plan, or modified the project with restrictions or conditions, in light of their Appropriate Assessment findings.
- 10.14 Where adverse effects cannot be ruled out, there are further exceptional tests set out in Regulation 62 for plans and projects and in Regulation 103 specifically for land use plans. Exceptionally, a plan or project could be taken forward for imperative reasons of overriding public interest where adverse effects cannot be ruled out and there are no alternative solutions. It should be noted that meeting these tests is a rare occurrence and ordinarily, competent authorities seek to ensure that a plan or project is fully mitigated for, or it does not proceed.

- 10.15 In such circumstances where a competent authority considers that a plan or project should proceed under Regulations 62 or 103, they must notify the relevant Secretary of State. Normally, planning decisions and competent authority duties are then transferred, becoming the responsibility of the Secretary of State, unless on considering the information, the planning authority is directed by the Secretary of State to make their own decision on the plan or project at the local level. The decision maker, whether the Secretary of State or the planning authority, should give full consideration to any proposed 'overriding reasons' for which a plan or project should proceed despite being unable to rule out adverse effects on European site interest features, and ensure that those reasons are in the public interest and are such that they override the potential harm. The decision maker will also need to secure any necessary compensatory measures, to ensure the continued overall coherence of the European site network if such a plan or project is allowed to proceed.
- 10.16 Once a plan is in place, projects will come forward in accordance with the plan, and each project must again be the subject of HRA, taking direction from the HRA work undertaken at the plan level. The tests to be met are the same at both the plan and project level, as is the rigor applied in meeting those tests. At the project level however, there is likely to be a greater level of detail and location specific evidence to draw upon. Where policies have been put in place at the plan level to protect European sites, divergence from them is likely to require additional evidence at the project level to demonstrate that divergence from policy will not adversely affect European sites.

Figure 2: Outline of the assessment of plans under the Habitat Regulations

- 10.17 In assessing the implications for European sites of any plan or project, research and evidence gathering underpinning the assessment usually consists of three types of information:
- The European sites
 - The plan or project
 - Potential impacts
- 10.18 In order to assess the implications of a plan or project for European sites, it is necessary to fully understand the European sites in question, to establish whether site features could potentially be affected.
- 10.19 It is also necessary to appreciate the purpose and objectives of the plan or project, to understand its constituent parts, how and when it will be implemented, and what may occur as a consequence of its implementation. A further evidence gathering requirement relates to any information that may assist with establishing and assessing the potential impacts that may occur. This may be locally specific information, or relevant evidence from elsewhere that can contribute to the understanding of potential impacts. This could include for example, studies on similar species, habitats or impacts in different locations, or the monitoring of mitigation approaches elsewhere that may be applicable. Previous HRA work that relates to the plan or project links with the evidence gathered on potential impacts, as previous assessment work will highlight what was previously considered a potential risk, and how such impacts were mitigated for.
- 10.20 Potential impacts are the link between the plan or project and the European sites. The HRA is assessing an 'interaction' between the plan or project, and the European site features. For this reason, the link is very often referred to as the 'impact pathway.' They are the route by which a plan or project may affect a European site (Figure 2).

Figure 2: Impact Pathways

11. Appendix 2: Conservation Objectives

11.1 As required by the European Directives, 'Conservation Objectives' have been established by Natural England, which should define the required ecologically robust state for each European site interest feature. All sites should be meeting their conservation objectives. When being fully met, each site will be adequately contributing to the overall favourable conservation status of the species or habitat interest feature across its natural range. Where conservation objectives are not being met at a site level, and the interest feature is therefore not contributing to overall favourable conservation status of the species or habitat, plans should be in place for adequate restoration.

11.2 Natural England is progressing a project to renew all European site Conservation Objectives, in order to ensure that they are up to date, comprehensive and easier for developers and consultants to use to inform project level Habitats Regulations Assessments in a consistent way. In 2012, Natural England issued now a set of generic European site Conservation Objectives, which should be applied to each interest feature of each European site. These generic objectives were the first stage in the project to renew conservation objectives, and the second stage, which is to provide more detailed and site specific information for each site to support the generic objectives, is now underway. This site-specific information is referred to as 'Supplementary Advice.'

11.3 The new list of generic Conservation Objectives for each European site includes an overarching objective, followed by a list of attributes that are essential for the achievement of the overarching objective. Whilst the generic objectives currently issued are standardised, they are to be applied to each interest feature of each European site, and the application and achievement of those objectives will therefore be site specific and dependant on the nature and characteristics of the site. The second stage, providing the Supplementary Advice will underpin these generic objectives with much more site-specific information.

11.4 Whilst the Supplementary Advice has been prepared for some of the European sites, it is currently still not available for many of the sites. Once finalised, this site-specific detail will play an important role in informing future HRAs, giving greater clarity to what might constitute an adverse effect on a site interest feature.

11.5 In the interim, Natural England advises that HRAs should use the generic objectives and apply them to the site-specific situation. This should be supported by comprehensive and up to date background information relating to the site.

11.6 For SPAs, the overarching objective is to:

11.7 'Avoid the deterioration of the habitats of qualifying features, and the significant disturbance of the qualifying features, ensuring the integrity of the site is maintained and the site makes a full contribution to achieving the aims of the Birds Directive.'

11.8 This is achieved by, subject to natural change, maintaining and restoring:

- The extent and distribution of the habitats of the qualifying features.

- The structure and function of the habitats of the qualifying features.
- The supporting processes on which the habitats of the qualifying features rely.
- The populations of the qualifying features.
- The distribution of the qualifying features within the site.

11.9 For SACs, the overarching objective is to:

'Avoid the deterioration of the qualifying natural habitats and the habitats of qualifying species, and the significant disturbance of those qualifying species, ensuring the integrity of the site is maintained and the site makes a full contribution to achieving Favourable Conservation Status of each of the qualifying features.'

11.10 This is achieved by, subject to natural change, maintaining and restoring:

- The extent and distribution of the qualifying natural habitats and habitats of qualifying species.
- The structure and function (including typical species) of qualifying natural habitats and habitats of qualifying species.
- The supporting processes on which qualifying natural habitats and habitats of qualifying species rely.
- The populations of qualifying species.
- The distribution of qualifying species within the site.

11.11 This HRA therefore has regard for the generic SAC related objectives. Conservation objectives inform HRAs by identifying what the interest features for the site should be achieving, and what impacts may be significant for the site in terms of undermining the site's ability to meet its conservation objectives.

11.12 In seeking to give site specific context to the generic objectives in the absence of site specific supplementary advice, HRAs should have regard for the site-specific attributes that contribute to the maintenance of the site interest features. Where such attributes are or have historically declined in extent, quality or abundance, there is a need for restorative measures to enable the conservation objectives to be met. This should be recognised in any HRA, as the assessment should not only ensure that the plan or project does not detract from the maintenance of the site interest features, but rather it should also ensure that the plan or project does not obstruct or reduce the effectiveness of current or future measures to restore the site.

12. Appendix 3: European site interest features

12.1 The following European sites were screened in the original Habitats Regulations Assessment Work for the Breckland Local Development Framework as those within a 20km radius that could potentially be affected by the implementation of policies contained within.

- The Broads SAC
- Broadland SPA/Ramsar
- Breckland SPA/SAC
- North Norfolk Coast SPA/Ramsar/SAC
- The Wash SPA/Ramsar
- Norfolk Valley Fens SAC
- The Wash & North Norfolk Coast SAC
- Ouse Washes SAC/SPA/Ramsar
- River Wensum SAC
- Waveney and Little Ouse Valley Fens SAC
- Redgrave and South Lopham Fen Ramsar

12.2 The interest features for each European site designation are listed below in Table 4. The overarching Conservation Objectives set out in Appendix 2 should be applied to each of these interest features. As noted in Appendix 2, detailed supplementary information for each interest feature will be developed as part of the Conservation Objectives in due course. Further detailed description of each interest feature in terms of its characteristics within the individual European site is provided on the JNCC website. Four figure reference numbers are the EU reference numbers given to each habitat and species listed within the Annexes of the European Directives.

Table 4: Reasons for designation of European sites where there may be potential impacts arising from the new Local Plan

Site	Reason for designation, * indicate a priority SAC feature
The Broads SAC	3140 Hard oligo-mesotrophic waters with benthic vegetation of Chara spp. 3150 Natural eutrophic lakes with Magnopotamion or Hydrocharition- type vegetation 7140 Transition mires and quaking bogs 7210 Calcareous fens with Cladium mariscus and species of the Caricion davalliana* 7230 alkaline fens 91E0 Alluvial Forests with Alnus glutinosa and Fraxinus excelsior (Alno-Padion, Alnion incanae, Salicion albae)* 6410 Molinia meadows on calcareous, peaty or clayey-silt-laden soils (Molinion caeruleae) – <i>qualifying feature but not a primary reason for site selection</i> 1016 Desmoulin`s whorl snail Vertigo moulinsiana 1903 Fen orchid Liparis loeselii 4056 Ramshorn snail Anisus vorticulus 1355 Otter Lutra lutra - <i>qualifying feature but not a primary reason for site selection</i>
Broadland SPA	
Broadland Ramsar	Data sheet does not break down into criterion, provides a general description to include: Extensive peatlands, shallow lakes, large range of wetland types, wet grazing marsh, outstanding assemblage of breeding and wintering wetland birds and rare plants and invertebrates

Site	Reason for designation, * indicate a priority SAC feature
Breckland SAC	2330 Inland dunes with open <i>Corynephorus</i> and <i>Agrostis</i> grasslands 3150 Natural eutrophic lakes with <i>Magnopotamion</i> or <i>Hydrocharition</i> - type vegetation 4030 European dry heaths 6210 Semi-natural dry grasslands and scrubland facies on calcareous substrates (<i>Festuco-Brometalia</i>) (important orchid sites) 91E0 Alluvial forests with <i>Alnus glutinosa</i> and <i>Fraxinus excelsior</i> (<i>Alno-Padion</i> , <i>Alnion incanae</i> , <i>Salicion albae</i>) * - qualifying feature but not a primary reason for site selection 1166 Great crested newt <i>Triturus cristatus</i> - qualifying feature but not a primary reason for site selection
Breckland SPA	Article 4.1 qualification of breeding populations of: A133 <i>Burhinus oedicephalus</i> A224 <i>Caprimulgus europaeus</i> A246 <i>Lullula arborea</i>
The Wash and North Norfolk Coast SAC	

Site	Reason for designation, * indicate a priority SAC feature
North Norfolk Coast SPA	
North Norfolk Coast SAC	
North Norfolk Coast Ramsar	<p>Data sheet does not break down into criterion, provides a general description to include:</p> <p>40km stretch of coastline including shingle beaches, sand dunes, saltmarsh, intertidal mud and sand flats, brackish lagoons, reedbeds and grazing marshes. Internationally important numbers of breeding and overwintering bird species. Several important botanical sites and breeding localities for natterjack toad Bufo calamita.</p>

Site	Reason for designation, * indicate a priority SAC feature
River Wensum SAC	<p>3260 Water courses of plain to montane levels with the <i>Ranunculion fluitantis</i> and <i>Callitriche-Batrachion</i> vegetation</p> <p>1092 white-clawed (or Atlantic stream) crayfish <i>Austropotamobius pallipes</i></p> <p>1016 Desmoulin`s whorl snail <i>Vertigo moulinsiana</i> - qualifying feature but not a primary reason for site selection</p> <p>1096 Brook lamprey <i>Lampetra planeri</i> - qualifying feature but not a primary reason for site selection</p> <p>1163 Bullhead <i>Cottus gobio</i> - qualifying feature but not a primary reason for site selection</p>
Ouse Washes SAC	1149 Spined loach <i>Cobitis taenia</i>

Site	Reason for designation, * indicate a priority SAC feature
Ouse Washes SPA	<p>Article 4.1 qualification of overwintering populations of:</p> <p>.</p> <p>.</p> <p>.</p> <p>Article 4.2 qualification (migratory species - breeding):</p> <p>.</p> <p>.</p> <p>.</p> <p>Article 4.2 qualification (migratory species - overwintering):</p> <p>.</p> <p>.</p> <p>.</p> <p>.</p> <p>Article 4.2 qualification (species assemblage): During the breeding season the area regularly supports: <i>Gallinago gallinago</i> , <i>Gallinula chloropus</i> , <i>Haematopus ostralegus</i> , <i>Tadorna tadorna</i> , <i>Tringa totanus</i> , <i>Vanellus vanellus</i> .</p> <p>Over winter the area regularly supports: <i>Phalacrocorax carbo</i> , <i>Cygnus columbianus bewickii</i>, <i>Cygnus cygnus</i> , <i>Anas penelope</i> , <i>Anas strepera</i> , <i>Anas crecca</i> , <i>Anas acuta</i> , <i>Anas clypeata</i> , <i>Aythya ferina</i> , <i>Aythya fuligula</i> , <i>Fulica atra</i> , <i>Philomachus pugnax</i> .</p> <p>64428 waterfowl (5 year peak mean 01/04/1998)</p> <p>Including:</p> <p><i>Phalacrocorax carbo</i> , <i>Cygnus columbianus bewickii</i> , <i>Cygnus cygnus</i> , <i>Anas penelope</i> , <i>Anas strepera</i> , <i>Anas crecca</i> , <i>Anas acuta</i> , <i>Anas clypeata</i> , <i>Aythya ferina</i> , <i>Aythya fuligula</i> , <i>Fulica atra</i> , <i>Philomachus pugnax</i> .</p>
Ouse Washes Ramsar	<p>Criterion 1a – representative example of a natural or near-natural wetland characteristic of its biogeographic region, one of the most extensive areas of seasonally flooding washland of its type in Britain.</p> <p>Criterion 2a – appreciable numbers of nationally rare plants and animals</p> <p>Criterion 5 - internationally important waterfowl assemblage</p> <p>Criterion 6 – internationally important overwintering bird populations</p>

Site	Reason for designation, * indicate a priority SAC feature
Waveney and Little Ouse Fens SAC	
Redgrave and South Lopham Fen Ramsar	<p>Criterion 1 – extensive example of spring-fed lowland base-rich valley, remarkable for its lack of fragmentation</p> <p>Criterion 2 – Rare and scarce invertebrates, including fen raft spider <i>Dolomedes plantarius</i></p> <p>Criterion 3 - Rare and scarce invertebrates, including fen raft spider <i>Dolomedes plantarius</i> and site diversity, due to the lateral and longitudinal zonation of the vegetation types characteristic of valley mires.</p>

13. Appendix 4: LSE Screening table at Publication

Breckland Local Plan Publication HRA

Plan section and policy	Description	LSE screening	Notes in relation to previous HRA recommendations	Current recommendations for modifications to plan text	Requirements for AA	Update at Publication stage
Introduction - text	Explaining the 'Publication' stage of plan making	LSE – issue relates to correct reference to Habitats regulations only		Ensure reference to the Habitats Regulations at paragraph 1.15 is up to date – Regulation 102 (not 85). Ensure that the Key Diagram is up to date with the latest SPA buffer zones	N/A	Text checked and recommendations now incorporated. No further action required
Introduction – Breckland’s Spatial Vision	Achievements by the end of the plan period (2036) explained	LSE - Vision includes reference to natural assets, but supporting text sets out some of the key growth and infrastructure aspirations for the District, including those within specific policies and assessed below	Previous HRA work made reference to the need to re-check and update mitigation measures	Consider as part of the AA	Themes relating to roads (A11, A47 and NDR) and housing are part of the AA. Mitigation measures are considered as part of the AA themes, AEOI can only be ruled out with the incorporation of mitigation measures within the plan.	AA REQUIREMENTS
Introduction – Strategic Objectives	Objectives that need to be met in order to achieve the Vision	LSE – The plan now has strong wording here in relation to the natural environment, but the roads and new housing objectives need to be considered	Previous HRA work made reference to the need to re-check and update mitigation measures	Consider as part of the AA	Themes relating to roads (A11, A47 and NDR) and housing are part of the AA. Mitigation measures are considered as part of the AA themes, AEOI can only be ruled out with the	AA REQUIREMENTS

Plan section and policy	Description	LSE screening	Notes in relation to previous HRA recommendations	Current recommendations for modifications to plan text	Requirements for AA	Update at Publication stage
					incorporation of mitigation measures within the plan.	
GEN 1 - Sustainable Development in Breckland	A general policy that describes what sustainable development is for the Breckland area, in accordance with principles of social, environmental and economic benefits	No LSE A very high level and general policy without any indication of the direction, quantum or nature of growth.	As previous	N/A	N/A	N/A
GEN2 – Promoting High Quality Design	Criteria for high quality development in relation to architecture, public realm, amenity and quality of life	Qualitative policy to improve quality of development proposals	No LSE - Qualitative	Policy not included in previous plan stages	N/A	N/A
GEN 3 – Settlement Hierarchy	The hierarchy of towns and villages for which development will be supported	LSE – Residential growth risks impacts on European sites and mitigation needs to be re-checked	As previous – proceed to AA	Consider as part of the AA	Themes relating to housing are part of the AA. Mitigation measures are considered as part of the AA themes, AEOI can only be ruled out with the incorporation of mitigation measures within the plan.	AA REQUIREMENTS
GEN4 – Development Requirements of Attleborough Strategic Urban Extension (SUE)		LSE – Residential growth risks impacts on European sites and mitigation needs to be re-checked	Vision not previously included	Consider as part of the AA	Themes relating to housing and water are part of the AA. Mitigation measures are considered as part of the AA	Point 13 of the policy now amended to require the information from the developer necessary to inform the

Breckland Local Plan Publication HRA

Plan section and policy	Description	LSE screening	Notes in relation to previous HRA recommendations	Current recommendations for modifications to plan text	Requirements for AA	Update at Publication stage
		Masterplan spec includes HRA considerations – point 12 of policy			themes, Masterplan will need HRA	Council’s project level HRA and ensure recreation is considered. AA REQUIREMENTS FOR WATER
Vision for Thetford and TAAP policies	Vision for the town by the end of the plan period in 2036. TAAP policies will be rolled forward	No LSE - All TAAP policies have been the subject of HRA for that plan. TAAP policies to be lost are adequately replaced. A key mitigation measure is the restoration and maintenance of the urban heaths in and around Thetford. Also, Norfolk visitor work highlights need to consider scale of change in recreation at sensitive sites from Thetford.	Vision not previously included		N/A NB – Thetford SUE has outline permission but S106 not yet agreed, partly due to outstanding mitigation requirements for Breckland SPA N/A	Council now developing a working group to consider the outcome of the visitor pressure study and collectively to consider ways in which to adopt a more coordinated approach to management and mitigation delivery. Mitigation progress should form part of Local Plan monitoring.
GEN5 – Settlement Boundaries	if compliant with policy, outside these,	LSE	Policy not included in previous plan stages	Add in Policy ENV 3 to the list of key policies. Whilst all environmental policies must be adhered to, ENV 3 is critical and	None – text modifications only to screen out LSE	Policy checked and recommendations now incorporated. No further action required

Breckland Local Plan Publication HRA

Plan section and policy	Description	LSE screening	Notes in relation to previous HRA recommendations	Current recommendations for modifications to plan text	Requirements for AA	Update at Publication stage
	development is only acceptable if it meets key criteria			relevant when a proposal is outside a settlement.		
HOU 01 – Development requirements, minimum	Sets the overall target for new housing over the plan period at 15,300 new homes between 2012 and 2036. This equates to 612 dwellings per annum.	LSE – Update to the SHMA in 2017 now means the plan sets a housing target of 15,300 new homes up to 2036. Need to ensure robustness of mitigation measures	Previous HRA work made reference to the need to re-check and update mitigation measures	Consider as part of the AA	Themes relating to housing are part of the AA. Mitigation measures are considered as part of the AA themes, AEOI can only be ruled out with the incorporation of mitigation measures within the plan.	AA REQUIREMENTS
HOU 02 – Level and location of growth	Additional dwellings targets for each settlement	LSE – the housing development options were considered in previous HRA. Allocations are in line with previous HRA findings, therefore no specific LSE in relation to individual allocations, but need to ensure robustness of mitigation measures	Previous HRA work made reference to the need to re-check and update mitigation measures	Consider as part of the AA	Themes relating to housing are part of the AA. Mitigation measures are considered as part of the AA themes, AEOI can only be ruled out with the incorporation of mitigation measures within the plan.	AA REQUIREMENTS

HOU 03 – Development outside of the boundaries of local service centres			Policy not included in previous plan stages	Policy or supporting text needs to make clear that there are risks to Breckland SPA and that the policy does not support development outside settlement boundaries within the 1500m buffer zone. Outside this, there may be a need for project level HRA to ensure that there any effects on functionally linked land can be effectively mitigated for.	N/A	Policy was amended to add clause ‘subject to being supported by other policies in the Local Plan’ – this ensures that development must conform to policies ENV 2 and ENV 03 which protect designated sites and apply restrictions to Stone Curlew buffer. No further action required.
HOU 04 - Rural settlements with boundaries		LSE – some of the listed settlements are in close proximity to Breckland SPA. Criteria does not refer to SPA buffers.	Policy not included in previous plan stages	Policy or supporting text needs to make clear that there are risks to Breckland SPA and that the policy does not support development outside settlement boundaries within the 1500m buffer zone. Outside this, there may be a need for project level HRA to ensure that there any effects on functionally linked land	N/A	Policy was amended to add clause ‘subject to being supported by other policies in the Local Plan’ – this ensures that development must conform to policies ENV 2 and ENV 03 which protect designated sites and apply restrictions to Stone Curlew buffer. No further action required.

Breckland Local Plan Publication HRA

				can be effectively mitigated for.		
HOU 05 – Small villages and hamlets outside of settlement boundaries		LSE – some villages and hamlets are in close proximity to Breckland SPA. Criteria does not refer to SPA buffers.	Similar Policy in previous plan stages, but current wording now poses a clearer risk in relation to adding to build development.	Policy or supporting text needs to make clear that there are risks to Breckland SPA and that the policy does not support development outside settlement boundaries within the 1500m buffer zone. Outside this, there may be a need for project level HRA to ensure that there any effects on functionally linked land can be effectively mitigated for.	N/A	
HOU 06 – Principle of new housing		No LSE - Qualitative	Policy not included in previous plan stages	N/A		
HOU 07 – affordable housing				Recommendation still stands, not currently added to the supporting text.		

Plan section and		LSE screening	Notes in relation			Publication stage
		European sites is based on location and levels of housing, and where required will apply to all housing types.	housing to meet all mitigation requirements for European sites, which are applicable to all housing types, even if exempt from paying any other levy.			
HOU 08 – Provision for travellers and travelling show-people	Supports the provision of plots and pitches for gypsies, travellers and travelling show-people	LSE – project applicants need to be aware of the need for avoidance and mitigation requirements for European sites in the same way that residential housing is considered	Policy was previously qualitative, now includes quantum of pitches	Add further detail to supporting text to identify that residential housing mitigation requirements for European sites are applicable to of plots and pitches for gypsies, travellers and travelling show-people	N/A	amended to include reference to the European site mitigation in line with No further action required.
HOU 09 – Specialist housing	Qualitative policy encouraging good quality housing for older residents	No LSE - Qualitative	Policy not included in previous plan stages	N/A	N/A	
HOU 10 – Technical design standards for new homes	Qualitative policy to improve quality of housing proposals	No LSE - Qualitative	Policy not included in previous plan stages	N/A	N/A	
HOU 11) – Residential replacement,	Criteria for residential replacement, extension and alteration	No LSE Policy does not promote growth in any particular	Need for mitigation to protect European sites is based on	No LSE but would be beneficial for supporting text to note the potential need for	N/A	Reference to Habitats requirements and need for mitigation

14. Appendix 5: Recommended edits for Policy ENV 2 and ENV 3

14.1 This supporting text and policy wording was taken from the plan at draft submission stage. Footprint Ecology provided an initial set of revisions to share with Breckland Council (red text and strike-throughs) during the preparation of this HRA report, and then a set of further refinements (blue text and blue strike-throughs) at draft Submission stage. Paragraph numbers relevant to this report are included for ease of reference, but do not relate to the paragraph numbers within the final Publication version of the Local Plan. These recommendations for text and policy have now been fully incorporated into the Publication version of the Breckland Local Plan, and the new Stone Curlew buffer map (Map 2) has also been incorporated within the plan.

Sites, habitats and species of European, National & Local Nature Conservation Importance

14.2 The planning system has an important part to play in meeting the UK's national and international commitments for habitats and species. **In considering sustainable development proposals, the Council will have regard for the relevant biodiversity legislation and policy.** Section 40 of the Natural Environment and Rural Communities Act (2006) places a duty on all public authorities in England and Wales to have regard, in the exercise of their functions, to the purpose of conserving biodiversity. **The National Planning Policy Framework states that the planning system should contribute to the Government's commitment to halt the overall decline in biodiversity, seeking net gains where possible and establishing coherent ecological networks.** Regard should also be had to The Conservation of Habitats and Species Regulations 2010, **as amended, and the Wildlife and Countryside Act 1981, as amended.** A key purpose of **this duty biodiversity legislation and policy** is to embed **consideration of biodiversity protection, restoration and enhancement** as an integral part of policy making.

14.3 Breckland has a wide range of sites which are protected for their biodiversity or geological interest. The ecological network in the District is inherently connected to the wider Norfolk area and should be viewed as a component part of a much wider network which stretches beyond the District's boundaries. There are a range of protected sites in the District, arguably the most famous being The Brecks, an extensive area of largely conifer plantation and arable farmland but with extensive areas of heathland within the forest and arable landscape. The Brecks also includes fen, grazing marsh and naturally fluctuating waterbodies (meres and pingos).

14.4 A significant proportion of The Brecks, including arable farmland, is designated as European protected sites, forming the largest terrestrial protected area in Norfolk. These are designated for their suitability to support internationally important bird species, particularly Stone Curlews, Woodlark and Nightjar. 5.16 The District also contains a number of river valleys, including the Wensum, Waveney, Yare/Blackwater, Nar, Whitewater, Tud, Wissey, Little Ouse and Thet.

These have extensive areas of wetland habitats, comprised mainly of grazing marsh with areas of fen and reedbed; many of the rivers are recognised as chalk streams. Some of these habitats are European protected sites. 5.17 Other key ecological features of the District include extensive areas of woodland and shelter-belts, often associated with large estates, and arable landscape features, comprising Scots pine shelter-belts, hedgerows, mature trees, copses, ponds and field margins. Some of these areas are designated as County Wildlife Sites, of which Breckland has more than any other District in Norfolk. Designated or not, these areas are key components of the ecological network at a local scale and collectively, when viewed as part of the green infrastructure network, amount to a significant biodiversity resource.

14.5 From The Brecks to the Norfolk Valley Fens, the range of sites with conservation and environmental interest is broad. Protected sites in Breckland as shown on the policies map comprise: Internationally designated sites Special Protection Areas (SPAs); Special Areas of Conservation (SACs); Ramsar sites; Nationally designated sites Ancient Woodland; Sites of Special Scientific Interest; National Nature Reserve; Locally designated sites Local Nature Reserves; Roadside Nature Reserves; Regionally Important Geological and Geomorphological Sites; County Wildlife Sites.

14.6 The sites designated under the protections listed above are the key biodiversity sites and geological features in the District. The different sites benefit from varying degrees of protection based on the rarity of the habitat and the diversity of species that they support. The range and quality of these sites is crucial not only for the wildlife they support but also as an educational and cultural resource and in supporting the overall quality of life in Breckland. As such, these areas are key components of the aspiration of achieving successful and sustainable development in Breckland.

14.7 When preparing applications applicants should consider the potential effects of the application on biodiversity protected habitats, demonstrating that potential effects have been avoided, and where this is not possible, adequately mitigated for. Biodiversity net gains and contribution to ecological networks should be sought wherever possible. If, when considered alone or with existing and known future projects, an application is likely to affect a European site the applicant must provide a report accompanying the application showing the site(s) that may be affected together with sufficient information to enable the Council if necessary to undertake an appropriate assessment. The Habitats Regulations Assessment (HRA) refers to the whole process of assessment, including - where one is required - the appropriate assessment stage.

Policy ENV02 – Sites of International, European, National & Local Nature Conservation Importance

14.8 The highest level of protection will be given to European Sites, with development ~~(either alone or in combination with other plans or projects)~~ only permitted where **it can be demonstrated that** ~~There~~ **there** will be no adverse effect **(either directly or indirectly)** on the integrity of any European site **(either alone or in combination with other plans or projects)**, ~~or~~

14.9 Where measures to mitigate for potential If adverse effects are identified, it can be demonstrated that, as the result of the proposed mitigation measures must be justified as fit for purpose with appropriate evidence in order to allow a conclusion of, there will be no adverse effect on the integrity of any European site; or

14.10 If it cannot be ascertained that no adverse effect on **European site** integrity will result, the proposed development will only be **permitted** able to proceed where there is no alternative solution and there are imperative reasons of overriding public interest.

14.11 Development likely to have an adverse effect (either directly or indirectly) on a site of national, regional or local biodiversity, or geological interest, as identified on the Policies Map, will not be permitted unless:

- (a) It can be clearly demonstrated that there are reasons for the proposal that outweigh the need to safeguard the special ecological / geological interest of the site, ~~or~~ **and**
- (b) It has been demonstrated, where development would result in significant harm, that it cannot be reasonably located on an alternative site that would result in less or no harm, ~~or~~ **and**
- (c) **Residual harm, after all measures to** can be prevented, **and** adequately mitigated **will be adequately** ~~or~~ compensated for.

14.12 Where the Council considers that a designated site, protected species or any species or habitat of principal importance for conservation may be affected by a development proposal, an environmental impact assessment (EIA) will be required to be submitted with the planning application to assess effects on European sites and effects on flora and fauna. Whilst the EIA and Habitats Regulations Assessment (HRA) are separate and distinct elements, the EIA information is likely to inform **the Council's** ~~an applicant's~~ HRA where an appropriate assessment is required.

14.13 In accordance with the stepwise approach to protecting biodiversity, all development with the potential to affect biodiversity should demonstrate how such effects have been firstly, how effects that cannot be avoided have been minimised, and how net gains for biodiversity are being secured as part of the development.

14.14 Where development is permitted, the authority will consider the need for conditions or planning obligations to ensure the protection and enhancement of the site's nature conservation and / or geological interest. Where development is likely to have an impact upon a species that is not protected by other legislation, and in particular where a habitat or species is listed as a Priority Habitat or Species under Section 41 of the Natural Environment and Rural Communities Act (2006), there will be an expectation that the development proposal will be accompanied by an impact study commensurate with the scale of the impact and the importance of the species. Wherever a proposed development may have a detrimental impact upon a designated site or protected species, as appropriate conditions and/or planning obligations will be used to ensure

that appropriate mitigation measures are utilised. Policy ENV03 outlines specific requirements that apply to The Brecks SPA.

The Brecks Breckland Special Protection Area

14.15 Covering ~~39,141ha~~ 39,434ha of heathland, forest and arable farmland, The Brecks is of ~~International and~~ European value to birdlife. Designated in 2006 as a Special Protection Area (SPA) under the European Council's Directive on the Conservation of Wild Birds, The Brecks habitat is important for a range of ground-nesting birds including the Stone Curlew, Woodlark and Nightjar. The East of England supports 65% of the UK's breeding pairs of Stone Curlew where most breeding is located within the Brecks. The rich biodiversity of The Brecks is also recognised through other statutory conservation designations including four Special Areas of Conservation (SACs), numerous SSSI and National Nature Reserves (NNR), where the latter (NNRs and SSSIs) make up 40% of the total area.

14.16 Evidence used to support the adoption of the Core Strategy in 2009 ~~included~~ resulted in research ~~required~~ to inform the Habitats Regulations Assessment (HRA) of the Core Strategy which examined the effects of housing and roads on the distribution of the Stone Curlew in The Brecks. The adopted mitigation policy required that any new development which may impact on the SPA must be subject to Appropriate Assessment. ~~The measures are defined by buffers (Map X).~~ New development is not permitted within 1,500m of the edge of the SPA (~~primary buffer (red)~~) unless it can be demonstrated by an appropriate assessment that the development would not adversely affect the integrity of the SPA. ~~Such circumstances may include~~ There is also provision for the use of existing buildings and development where completely masked from the SPA by existing development.

14.17 Stone Curlews are also found outside the SPA; these birds are clearly part of the SPA population and functionally linked. Accordingly, ~~a secondary buffer (blue) indicated areas that have been identified where there are concentrations of Stone Curlew (most recently using data from 2011-2015). gathered with five or more nests recorded over the period 2007-2015, which builds on the original data analysed over the periods 1995-2006, and 2007-2015.~~

14.18 Within these areas development ~~can~~ ~~may~~ be brought forward, providing ~~a project level Habitats Regulations Assessment can demonstrate adverse effects have been prevented, for example where~~ alternative land outside the SPA can be secured to ~~adequately~~ mitigate ~~for~~ the potential effects.

14.19 In 2013 a "Further Assessments of the Relationship between Buildings and Stone Curlew Distribution" study was carried out to update previous work on the effect of buildings and roads on Stone Curlews in The Brecks. Including new analysis and using additional survey data, this study report focused on the effects of buildings on the distribution of breeding Stone Curlew in The Brecks. The report provides strong support for the continuation of a 1500m zone around the

areas capable of supporting Stone Curlews. Within this zone additional development is likely to have a significant effect on the SPA. ~~An appropriate assessment will be required in cases where the integrity of the SPA would be adversely affected following HRA screening.~~

14.20 The 2013 research also suggests that the planting of woodland/screening as a mitigation measure is unlikely to be effective and that the effect of nest density is strongest as a result of the amount of buildings ~~rather than type~~. One of the key aims of the research was to differentiate the effects of nest density due to different building classes. Due to the sample size and number of buildings identified there needs to be an element of caution applied to the results, however, the research indicates that there was no evidence of a negative impact of agricultural or commercial buildings. As such, the analysis suggests ~~an element of flexibility could be applied for~~ **that project level HRA for non-residential development in the SPA buffer zones may be able to demonstrate that adverse effects can be ruled out.**

14.21 A draft protocol entitled 'Agricultural Buildings and the Breckland Special Protection Area stone curlew constraint zone' was produced by Natural England (2013) with input from stakeholders. ~~Natural England suggested that Breckland Council may wish to update and formally adopt this protocol to take account of the most recent Footprint Ecology report and expand it to include commercial buildings, and this has therefore been taken into account in the Local Plan HRA. For non-residential Agricultural buildings developments~~ which meet certain criteria, ~~this~~ should result in a simplified Habitats Regulations Assessment. This has been reflected in the policy wording. ~~Further consideration of the evidence is required to determine whether other building types could also be added.~~

14.22 Further analysis of the most recent Stone Curlew survey data allowed for some minor revisions to the primary (red) and secondary (blue) buffers to ensure they remain founded upon up to date information. Areas where data is absent, but could potentially provide functionally linked land, is identified by orange cells. Here a likely significant effect is presumed until project level Habitats Regulations Assessment provides additional information.

14.23 A report providing a comprehensive analysis of current and projected visitor patterns to European protected sites across Norfolk was commissioned by Norfolk County Council and the Norfolk Biodiversity Partnership on behalf of Local Authorities and completed in 2017. The report entitled 'Visitor surveys at European protected sites across Norfolk during 2015 and 2016' highlights that whilst survey areas in The Brecks received a much lower number of visitors than other survey sites such as those on the Norfolk coast, the proportion of local visitors (with Norfolk postcodes) was significantly higher to sites in The Brecks. The report presents evidence that of all designated sites included in the survey, Breckland SPA had the highest proportion of local visitors to the Brecks, from the settlements of Thetford, Mildenhall, Swaffham, Mundford, Brandon (of which Mildenhall and Brandon are outside the District within Suffolk). There is therefore evidential support for mitigation strategies to apply to new development in those settlements.

14.24 The Thetford SUE represents the largest area of planned growth within the District which would result in increased recreational pressure in The Brecks. A number of strategic mitigation

measures were accepted as part of the adopted Thetford Area Action Plan in July 2012 which have been saved through this Local Plan. Further measures have been incorporated within a number of site allocation policies within the plan to ensure that mitigation is provided to reduce the impact of recreational pressure on designated sites.

Policy ENV03 The Brecks Protected Habitats & Species

14.25 The Council requires that a **Habitats Regulations** Assessment is undertaken on all proposals for development that are likely to have a significant effect on The Breckland Special Protection Area (SPA) which is classified for its populations of Stone Curlew, Woodlark and Nightjar, **and/or Breckland Special Area of Conservation (SAC), which is designated for its heathland habitats.** Development will only be permitted where it **can be demonstrated that the proposal** will not adversely affect the integrity of the SPA **or the SAC.**

Stone Curlew

14.26 Plan level Habitats Regulations Assessment has been undertaken to identify where built development is likely to significantly affect the Breckland SPA. **Map X identifies a 1,500m buffer zone from the edge of those parts of the SPA that support, or are capable of supporting, Stone Curlew, where new built development would be likely to significantly affect the SPA population. The plan level Habitats Regulations Assessment also identifies areas that have a functional link to the SPA, because they support Stone Curlew outside, but in close proximity to the SPA boundary. These areas also have a 1500m buffer zone, within which new built development would be likely to significantly affect the SPA population.**

14.27 A conclusion of no likely significant effect can be met where the proposed building is located further than 1500m away from the SPA boundary (**red primary buffer**) or the identified (**blue secondary buffer**) or possible (**orange cells**) areas that have a functional link (**see Map X**).

14.28 **Development within the SPA boundary, or located less than 1500m away from the SPA boundary or identified areas that have a functional link (see Map X) will not normally be permitted.**

14.29 Where a proposed building is outside the SPA but within 1500m of the SPA boundary or identified **or possible** areas that have a functional link (see Map X), there may be circumstances where a project level Habitats Regulations Assessment is able to demonstrate that the proposal will not adversely affect the integrity of the SPA. **For agricultural buildings,** applicants must provide evidence to show how their proposal meets the criteria listed in Natural England's "Agricultural Buildings and the Breckland SPA Stone Curlew constraint zone" advice note, or successor document.

14.30 Circumstances where the proposal is able to conclusively demonstrate that it will not result in an adverse effect on Breckland SPA may include where the proposal is:

- More than 1500m away from potential stone curlew [nesting sites](#) habitat (such as arable land) inside the SPA (~~these are those parts of the SPA that are also designated as Breckland Farmland SSSI~~);
- A new building **that will** be completely masked [on all sides](#) from the SPA by existing built development;
- A proposed re-development of an existing building that would not alter its footprint **or increase its potential impact**;
- A new agricultural building of less than 120 sqm;
- An extension to existing agricultural buildings of less than 120 sqm or 100% of the original, whichever is less.

14.31 (b) Permission may be granted for agricultural buildings where:

- there is a demonstrable need for the facility (necessary to manage the agricultural land/maintain the economic viability of an agricultural enterprise);
- justification is provided as to why it cannot be located elsewhere (outside the buffer zone); and
- justification that the selected location is the least detrimental.

[Large developments adjacent to or just outside the primary or secondary buffer, particularly where occurring in an isolated area with few other buildings, are likely to also require project level assessment](#)

Woodlark and Nightjar

14.32 Development within 400m of the SPA that support, or are capable of supporting Woodlark and/or Nightjar will not normally be permitted.

14.33 The Council will consider the need for a **Habitats Regulations** Assessment to determine the implications of development on ~~other interest features of the SPA (i.e. Nightjar and Woodlark on a~~ case by case basis, **depending on the location and nature of the proposal**.

Recreation pressure and urban effects

14.34 Plan level Habitats Regulations Assessment has identified the potential for increased disturbance to Nightjar, Woodlark and Stone Curlew as a result of recreation, and the potential for other urban effects such as increased fire, litter and eutrophication to significantly affect Breckland SPA and SAC.

14.35 The Council will work with partners to develop a framework of measures that manage and monitor access. Proposals for ~~major~~ development in Thetford, Swaffham and Mundford will be required to demonstrate the inclusion of mitigation measures that contribute to the framework to

address the potential impact of increased recreational pressure on Breckland SPA. This should comprise:

- new on-site recreational areas in accordance with other policy requirements in this plan, **and/or**
- other measures that contribute to managing recreation pressure, such as educational/information materials, staff resources, managing car parking and projects targeting dog walking

14.36 or; where the development will not provide on-site recreational space:

- promotional materials for new residents to advertise existing local suitable alternative natural green space for recreation.

14.37 The Council will work with partners to develop a framework for managing and monitoring urban effects. Proposals for development where urban heaths at Thetford (Barnham Cross Common, Thetford Heath, Thetford Golf Club and Marsh), East Wretham or Brettenham are likely to be used as local greenspace will need to demonstrate the inclusion of mitigation measures that contribute to the framework to address the potential impact urban effects on Breckland SPA/SAC.
